200611 - AB - Bayesian Analysis

Coordinating unit: 200 - FME - School of Mathematics and Statistics
Teaching unit: 715 - EIO - Department of Statistics and Operations Research
Academic year: 2017
Degree: MASTER'S DEGREE IN STATISTICS AND OPERATIONS RESEARCH (Syllabus 2013). (Teaching unit Optional)
ECTS credits: 5

Teaching languages: English

Teaching staff
Coordinator: JOSEP GINEBRA MOLINS
Others: Segon quadrimestre:
JOSEP GINEBRA MOLINS - A
XAVIER PUIG ORIOL - A

Prior skills
We start from scratch and hence there are no pre-requisites for this course. But having some basic knowledge of statistics, at the level of what is covered in Chapters 1 to 12 of the 2004 book "All of Statistics" of Larry Wasserman will help get the best out of the first two thirds of the course. Having some basic knowledge of applied linear and generalized linear models, at the level of the 2005 book "Applied Linear Regression" by Sanford Weisberg will help get the best out of the last one third of the course.

Requirements
We start from scratch, without any pre-requisites. But having basic knowledge of statistics will help better understand the differences between the Bayesian approach to statistical inference and model selection and the non-Bayesian approach. Having some basic knowledge of applied linear and generalized linear models is not required but it will also help get the best out of this course.

Degree competences to which the subject contributes

Specific:
3. CE-1. Ability to design and manage the collection of information and coding, handling, storing and processing it.
4. CE-3. Ability to formulate, analyze and validate models applicable to practical problems. Ability to select the method and / or statistical or operations research technique more appropriate to apply this model to the situation or problem.
5. CE-4. Ability to use different inference procedures to answer questions, identifying the properties of different estimation methods and their advantages and disadvantages, tailored to a specific situation and a specific context.
6. CE-6. Ability to use appropriate software to perform the necessary calculations in solving a problem.
7. CE-7. Ability to understand statistical and operations research papers of an advanced level. Know the research procedures for both the production of new knowledge and its transmission.
8. CE-8. Ability to discuss the validity, scope and relevance of these solutions and be able to present and defend their conclusions.

Transversal:
1. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of
200611 - AB - Bayesian Analysis

contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.

2. FOREIGN LANGUAGE: Achieving a level of spoken and written proficiency in a foreign language, preferably English, that meets the needs of the profession and the labour market.

Teaching methodology

There will be two 1.5 hour sessions per week. Two thirds of the sessions will be in a regular classroom and one third of them will be in a computer lab.

Learning objectives of the subject

Abilities to be acquired:
* Knowledge of the difference between Bayesian and non-Bayesian statistical modelling, and of the role of the likelihood function.
* Knowledge of the advantages and of the disadvantages of Bayesian statistical modelling with respect to non Bayesian statistical modelling.
* Understand the differences between Bayesian and Non-Bayesian inference.
* Understand the role of the prior distribution, the role of reference priors and how to go from prior to posterior distributions.
* Understand the difference between hierarchical and non-hierarchical Bayesian models.
* Understand how to check a Bayesian model, how to compare Bayesian models and how to use them for prediction.
* Understand the Monte Carlo methods that allow one to simulate from the posterior and how to make inferences from those simulations.
* Posing and solving Bayesian inference problems analytically with exponential family statistical models and conjugate prior distributions.
* Posing and solving Bayesian inference problems numerically under complex situations using WinBugs.

## Content

### 1- Bayesian Model

**Learning time:** 18h  
| Theory classes: | 9h |  
| Laboratory classes: | 4h 30m |  
| Self study: | 4h 30m |  

**Description:**  

### 2- Bayesian Inference

**Learning time:** 18h  
| Theory classes: | 9h |  
| Laboratory classes: | 4h 30m |  
| Self study: | 4h 30m |  

**Description:**  

### 3- Hierarchical Models

**Learning time:** 6h  
| Theory classes: | 3h |  
| Laboratory classes: | 1h 30m |  
| Self study: | 1h 30m |  

**Description:**  

### 4. Model selection

**Learning time:** 6h  
| Theory classes: | 3h |  
| Laboratory classes: | 1h 30m |  
| Self study: | 1h 30m |  

**Description:**  
Students will have to hand in several assignments and work on a final project that will be graded and will alltogether count as 45% of the final grade.

Final grade = 0.2*Assignm + 0.2*Proj + 0.1*Midterm + 0.5*FinalExam

**Qualification system**

Students will have to hand in several assignments and work on a final project that will be graded and will alltogether count as 45% of the final grade.

Final grade = 0.2*Assignm + 0.2*Proj + 0.1*Midterm + 0.5*FinalExam

**Regulations for carrying out activities**

The midterm and the final exam will be closed book but you might need to bring a calculator.
