This course introduces the concepts, principles and basics of the different tools related to information technologies (IT) applying them to business and industry. This course will focus IT on industrial organization and decision making support.

Learning objectives of the subject

The course is divided into three parts:

Theory classes
Guided activities class
Self-study for doing exercises and activities.

In the theory classes, teachers will introduce the theoretical basis of the concepts, methods and results and illustrate them with examples appropriate to facilitate their understanding.

In the guided activity class (in the classroom), teachers guide students in applying theoretical concepts to solve problems, always using critical reasoning. We propose that students solve exercises in and outside the classroom, to promote contact and use the basic tools needed to solve problems.

Students, independently, need to work on the materials provided by teachers and the outcomes of the sessions of exercises/problems, in order to fix and assimilate the concepts.

The teachers provide the curriculum and monitoring of activities (by ATENEA).

Qualification system

The course mark depends on:

A project: 50%
Problem resolution: 50%

Regulations for carrying out activities

There are no specific rules
