Learning objectives of the subject

. To authorize the student for the comprehension and analysis of the problems that appear during the process of automation of tasks using robots.
. To acquire skills in the use of robots.
. To acquire skills in order to robotize tasks and processes.
. To introduce the student to the complexity of the integration of different technologies with the robotics world.

Content

Applied Robotics: real case study and implementation

Learning time: 75h
- Theory classes: 27h
- Self study: 48h

Description:
This course is based in the practical development of a "hands-on" application of a robotized system applied to a real case study. The applications must be proposed by lecturers and can include a different set of technologies all of them integrated with robotics (that is computer vision, artificial reasoning, PLCs, OPC, SCADA systems, etc). Projects will be mainly based on ABB industrial robots using RAPID as a program language, but some other robotic platforms as mobile robots or another kind of manipulators can be also considered. Applications will be developed by groups and teachers will assess and supervise each student’s teamwork in order to help them in the project development and to solve possible doubts. Nevertheless students, organized in teamwork need to work also in autonomous way, on the used equipment in order to develop solutions according to the project goals. Students could be asked to prepare written reports, oral presentations and public demonstration of the project functionality.

Specific objectives:
- To authorize the student for the comprehension and analysis of the problems that appear during the process of automation of tasks using robots.
- To acquire skills in the use of robots.
- To acquire skills in order to robotize tasks and processes.
- To introduce the student to the complexity of the integration of different technologies with the robotics world.

Qualification system

Partial laboratory test: 20%
Project results: 50%
Small project modification: 30%

The course will provide procedures enabling to retrieve the partial unsatisfactory marks.
Regulations for carrying out activities

Partial laboratory test will be performed individually in person and in writing. Project results will be performed in groups and must be a final demonstration. Small project modification will be performed individually in person using as a base the application developed during the course.

Activity 4 will take place individually in person and in writing.
