240604 - Identification and Simulation of Dynamic Systems

Coordinating unit: 240 - ETSEIB - Barcelona School of Industrial Engineering
Teaching unit: 707 - ESAII - Department of Automatic Control
Academic year: 2017
Degree: BACHELOR'S DEGREE IN MATERIALS ENGINEERING (Syllabus 2010). (Teaching unit Optional)
ECTS credits: 4,5
Teaching languages: Catalan, Spanish

Teaching staff
Coordinator: YOLANDA BOLEA MONTE
Others: MIGUEL ANGEL MAÑANAS VILLANUEVA - YOLANDA BOLEA MONTE

Opening hours
Timetable: Agreed with the professors by e-mail.

Prior skills
It is assumed that the students will have skills acquired in previous subjects related subjects in the degree study plan.

Requirements
Basic knowledge of system dynamics, automatic control, computer science and mathematical modelling (acquired in subjects like Mechanics, Electricity, ...).

Degree competences to which the subject contributes

Specific:
1. Capacity to analyse, design, simulating and optimising processes and products.

Transversal:
2. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
3. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
4. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology
The course will be given by means of classes of theory/problems (2 hours per week) and by means of practical labs (2 hours per week).

In the theory/problems classes, professors will introduce basic concepts about the subject, that will allow students to complement with provided literature, and will present and solve problems/case studies.

Lab sessions will be organised in small groups of students (with a maximum of 20), where students will apply the concepts introduced in theory/problem classes using lab facilities in the provided case studies.
Learning objectives of the subject

To provide the students with the necessary tools for modeling and simulation of dynamic systems (chemical processes, robotic manipulators, bacteriological growth, ...) using physical models and experimental data. At the end of the course, the student has achieved the following specific objectives:
- Mathematical description of physical systems.
- Techniques of modeling and analysis of dynamic systems.
- Identification and parameterization of models from experimental data.
- Knowledge of simulation tools of dynamic systems and their use.

1. INTRODUCTION

Description:
1.1 Definitions.
1.2 Objectives.
1.3 Classification and examples of models.
1.4 External representation of systems: continuous and discrete-time.
1.5 Internal representation of systems: continuous and discrete-time.
1.6 Phases of system modelling. Examples.
1.7 Model simplification.
1.8 Basic concepts of simulation.

Related activities:
Classes of theory/problems

Specific objectives:
In this chapter, a unified methodology for modelling dynamic systems as well as the different model types used in simulation will be presented.

2. MODELLING OF DYNAMIC SYSTEMS

Description:
2.1 Models of electric systems
2.2 Models of mechanical systems
2.3 Models of hydraulic and pneumatic systems
2.4 Models of economic and social systems
2.5 Analogies between systems of different types

Related activities:
Classes of theory/problems

Specific objectives:
In this chapter, models of different domains typically used in engineering will be recalled and presented in an unified way by showing their analogies.
### 3. SIMULATION OF DYNAMIC SYSTEMS

**Description:**
3.1 Numerical methods for solving differential equations  
3.2 Numerical integration methods  
3.3 Tools for simulating dynamic systems  
3.4 Model validation  
3.5 Anàlisis de validesa dels models  
3.6 Exemples

**Related activities:**  
Classes of theory/problems

**Specific objectives:**  
In this chapter, methods and tools for numerical simulation of dynamic systems will be introduced.

**Learning time:** 13h  
Theory classes: 9h  
Practical classes: 4h

---

### 4. IDENTIFICATION OF DYNAMIC SYSTEMS

**Description:**
4.1 Input signals  
4.2 Non-parametric methods in the time domain  
4.3 Non-parametric methods in the frequency domain  
4.4 Parametric methods  
4.5 Least-squares method  
4.6 Output error method  
4.7 Prediction error method  
4.8 Instrument variable method  
4.9 Recursive methods  
4.10 Model structure selection and validation  
4.11 Practical aspects

**Related activities:**  
Theory/problem classes

**Specific objectives:**  
In this chapter, system identification methods that allow to obtain the model structure and parameters from experimental data are presented.

**Learning time:** 14h  
Theory classes: 10h  
Laboratory classes: 4h
# Planning of activities

## Support materials:
MATLAB/SIMULINK

### Descriptions of the assignments due and their relation to the assessment:
Report

### Specific objectives:
To learn to identify system models from experimental data.

---

### LAB 5: SYSTEM IDENTIFICATION (II)

<table>
<thead>
<tr>
<th>Hours</th>
<th>Laboratory classes: 2h</th>
</tr>
</thead>
</table>

**Description:**
In this lab, students will continue Lab 4 by applying other system identification methods.

**Support materials:**
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**
Report

**Specific objectives:**
To learn to identify system models from experimental data.

---

### LAB 6: SIMULATION MINIPROJECT

<table>
<thead>
<tr>
<th>Hours</th>
<th>Laboratory classes: 4h</th>
</tr>
</thead>
</table>

**Description:**
In this lab, students will work on a case study where different methodologies of modelling, identification and simulation studied in the course will be applied.

**Support materials:**
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**
Report

**Specific objectives:**
The objective of this miniproject is that student understand the role that the different methodologies presented in the course play when dealing with a real system.

---

### Qualification system

The evaluation will be realized by means of:
- partial exam (35% of the subject mark)
- final exam (45 % of the subject mark)
- lab reports (20% of the subject mark)
### Regulations for carrying out activities

The exam will be realized of individual form with the authorized supporting material and in the dates established in the academic calendar of the School.

### Bibliography

**Basic:**
