BARCELONATECH

Course guide
230690 - RMWC - Resource Management in Wireless Communications

Last modified: 06/05/2019

Unit in charge:	Barcelona School of Telecommunications Engineering
Teaching unit:	739 - TSC - Department of Signal Theory and Communications.

Degree:	**Academic year:** 2019	**ECTS Credits:** 5.0	
Languages: English			

LECTURER

Coordinating lecturer:	Sallent Roig, Jose Oriol
Others:	Sallent Roig, Jose Oriol

PRIOR SKILLS

Co-requirements:
- Mobile Communications Systems (for students of the WICOM master)
- Advanced Mobile Communications (for students of the MET master)

DEGREE COMPETENCES TO WHICH THE SUBJECT CONTRIBUTES

Specific:
CE2. Ability to develop radio-communication systems: antennas design, equipment and subsystems, channel modeling, link dimensioning and planning.
CE7. Ability to plan networks and decision-making about services and applications taking into account: quality of service, operational and direct costs, implementation plan, supervision, security processes, scalability and maintenance. Ability to manage and assure the quality during the development process
CE6. Ability to model, design, implement, manage, operate, administrate and maintain networks, services and contents
CE3. Ability to implement wired/wireless systems, in both fix and mobile communication environments.

Transversal:
CT5. FOREIGN LANGUAGE: Achieving a level of spoken and written proficiency in a foreign language, preferably English, that meets the needs of the profession and the labour market.

CT4. EFFECTIVE USE OF INFORMATION RESOURCES: Managing the acquisition, structuring, analysis and display of data and information in the chosen area of specialisation and critically assessing the results obtained.

TEACHING METHODOLOGY

- Lectures
- Application classes
- Individual work (distance)
- Exercises
- Short answer test (Control)
- Extended answer test (Final Exam)

Planning of activities:
Exercises:
- Description: Exercises to strengthen the theoretical knowledge.
Short answer test (Control):
- Description: Mid term control.
Extended answer test (Final examination):
- Description: Final examination.

LEARNING OBJECTIVES OF THE SUBJECT

Learning objectives of the subject:
The aim of this course is to train students in the analysis, modelling and design of radio resource management mechanisms for wireless communications systems, with a focus on mobile communications. The course will start by developing the concepts for designing and operating a mobile communication network, including the planning and dimensioning processes. Then, it will present the models and strategies for managing the network and the spectrum. For that purpose, the course will study different strategies for radio resource management and network optimisation, including advanced concepts for automated network optimisation (SON: Self-Organizing Networks).

Learning results of the subject:
- Knowledge of how to model, design and evaluate strategies and mechanisms for the management of the radio resources and the flexible use of the spectrum in wireless networks
- Knowledge of the deployment and resource management options for heterogeneous networks
- Knowledge of the strategies used for the automatic configuration and optimisation of wireless networks (self-organising networks)
- Knowledge of radio resource management strategies in wireless networks, including the modelling and the application of advanced decision making and machine learning strategies
- Knowledge of flexible spectrum management concepts: regulation, spectrum management components, spectrum sharing, dynamic spectrum access and cognitive radio.
- Knowledge about heterogeneous networks, including deployment, interference management, load control and use of multiple radio interfaces.
- Ability to analyze, model and evaluate advanced resource management and optimization techniques for wireless networks.

STUDY LOAD

Type	Hours	Percentage
Self study	86,0	68.80
Hours large group	39,0	31.20

Total learning time: 125 h

CONTENTS

1. Mobile Communication Networks: design and operation

Description:
- Engineering functions, organisation and processes
- Base station radio design
- Dimensioning
- Integration and operation
- Transmission
- Optimisation

Full-or-part-time: 35h
Theory classes: 9h
Practical classes: 2h
Self study : 24h

2. Network planning and dimensioning

Description:
- Introduction: Planning objectives and requirements
- Link budget in LTE for Uplink and Downlink: Propagation models; Receiver sensitivity; signal to noise ratio and Interference Margin. Clutter Concept.
- Traffic Dimensioning for LTE
- LTE network design: Frequency planning options; Dimensioning and planning of Control channels
- Backhaul and X2 interface dimensioning

Full-or-part-time: 19h
Theory classes: 4h
Practical classes: 2h
Self study : 13h

3. Network resource management

Description:
- Context, models and framework for network management (ITU FCAPS, eTOM, BSS/OSS/NMS)
- Radio Resource Management strategies (admission control, scheduling, handover, cell selection, eICIC, carrier aggregation, load balancing)
- Advanced algorithmic solutions for radio resource management (applicability of machine learning techniques)
- Network optimisation and SON (network quality cycle, optimisation methodologies and tools, network monitoring and optimisation)

Full-or-part-time: 55h
Theory classes: 13h
Practical classes: 4h
Self study : 38h

4. Spectrum management

Description:
- Licensing regimes and spectrum management models (LSA, TVWS, etc.)
- Coexistence studies

Full-or-part-time: 16h
Theory classes: 4h
Practical classes: 1h
Self study : 11h

GRADING SYSTEM

Final examination:50%
Partial examinations and controls: 40%
Exercises: 10%
