

## Guía docente

# 300086 - ACATM - Conceptos y Modelos Avanzados para la Gestión del Tráfico Aéreo

Última modificación: 01/06/2023

**Unidad responsable:** Escuela de Ingeniería de Telecomunicación y Aeroespacial de Castelldefels

**Unidad que imparte:** 748 - FIS - Departamento de Física.

**Titulación:** MÁSTER UNIVERSITARIO EN INGENIERÍA AERONÁUTICA (Plan 2014). (Asignatura optativa).

**Curso:** 2023

**Créditos ECTS:** 5.0

**Idiomas:** Inglés

## PROFESORADO

**Profesorado responsable:** Adeline de Villardi de Montlaur

**Otros:**

## CAPACIDADES PREVIAS

Previous concepts include knowledge of Air Traffic Management and optimization methods, given in any bachelor's degree in aerospace engineering and reviewed in previous subjects of this Master's degree, as well as familiarity with the use of computing tools for engineering. Familiarity with at least one computer language (C, Matlab, Python...) is required.

## REQUISITOS

220309 Air transport and Navigation Systems

## METODOLOGÍAS DOCENTES

Specific competence:

CEEaeronav2: Modelar, analizar y diseñar diferentes estrategias y algoritmos para el diseño del espacio aéreo, la gestión del equilibrio entre demanda y capacidad y la provisión de servicios de tránsito aéreo.

The course combines the following teaching methodologies:

- Theory classes.
- Autonomous learning: students will study using self-learning material.
- Cooperative learning: students will form small group (2-4 people) to fulfill some of the activities of the course.
- Project based learning: students will build a small team project (3-4 people).

Directed learning hours will consist in exercises and practical examples, after the theory classes in which the professor exposes the content of the subject. With the directed learning hours, the students will be motivated to participate actively in their education and to complete the knowledge acquired during theory classes, usually with the help of computers.

## OBJETIVOS DE APRENDIZAJE DE LA ASIGNATURA

In this course, new worldwide air traffic management systems, already developed or in the process of development will be presented. Some optimization techniques and operative research techniques used in the field will be proposed, as well as modeling and optimization techniques.

At the end of the course, the student will be able to:

- . identify current ATM challenges,
- . identify metrics, key performance areas and indicators relevant to the field,
- . model ATM problems using mathematical techniques, and choose the most adequate optimization technique,
- . validate research techniques related to air traffic management and air traffic control.

## HORAS TOTALES DE DEDICACIÓN DEL ESTUDIANTADO

Tipo	Horas	Porcentaje
Horas aprendizaje autónomo	80,0	64.00
Horas grupo pequeño	15,0	12.00
Horas grupo grande	30,0	24.00

**Dedicación total:** 125 h

## CONTENIDOS

### Introduction and review of new ATM concepts

#### Descripción:

- Harmonization of SESAR + NextGen
- Rest of the world (Onesky etc)
- Relevance of TBO and CDM

#### Dedicación: 6h

Grupo grande/Teoría: 2h

Grupo pequeño/Laboratorio: 1h

Aprendizaje autónomo: 3h

### Advanced concepts and models

#### Descripción:

- Air traffic flow management (ATFM):  
From Ration by schedule (RBS) to ground holding problem (GHP),  
Collaborative trajectory options (CTOP)  
Advanced demand and capacity balancing (A-DCB)
- Airspace management: DAC (dynamic airspace configuration, Flight-centric air traffic control (ATC), etc).
- Air traffic services (ATS): Conflict detection and resolution algorithms, Airspace capacity modelling, Integrated network and ATC planning (INAP), etc.
- User driven prioritisation processes

#### Dedicación: 31h

Grupo grande/Teoría: 8h

Grupo pequeño/Laboratorio: 3h

Aprendizaje autónomo: 20h

### ATM Performance

**Descripción:**

- ATM performance measurement, monitoring and target setting.
- ATM key performance areas (KPAs) and (key) performance indicators -(K)PI

**Dedicación:** 16h

Grupo grande/Teoría: 8h

Aprendizaje autónomo: 8h

### Project

**Descripción:**

Working in groups, the students will perform a literature review to select a current ATM challenge and will develop an algorithm to propose a solution to it. Focus will be made on identifying the problem, extracting realistic data, choosing the best method to solve it, validating the model and correctly extracting results, statistics and conclusions. Sustainability criteria will also be taken into account in the development of the solution.

**Dedicación:** 72h

Grupo grande/Teoría: 12h

Grupo pequeño/Laboratorio: 11h

Aprendizaje autónomo: 49h

## SISTEMA DE CALIFICACIÓN

Class participation and class exercises: 15%

Assignments and short presentations: 30%

Project: 55%
