

## Course guide

### 250717 - 250717 - Environmental Management

**Last modified:** 22/05/2024

<b>Unit in charge:</b>	Barcelona School of Civil Engineering	
<b>Teaching unit:</b>	758 - EPC - Department of Project and Construction Engineering.	
<b>Degree:</b>	MASTER'S DEGREE IN STRUCTURAL AND CONSTRUCTION ENGINEERING (Syllabus 2015). (Optional subject).	
<b>Academic year:</b> 2024	<b>ECTS Credits:</b> 5.0	<b>Languages:</b> Spanish

#### LECTURER

---

<b>Coordinating lecturer:</b>	MARTA GANGOLELLS SOLANELLAS
<b>Others:</b>	MARTA GANGOLELLS SOLANELLAS, JOSEP MANUEL SABATE IBAÑEZ

#### DEGREE COMPETENCES TO WHICH THE SUBJECT CONTRIBUTES

---

##### Specific:

13367. To apply innovative and sustainable technological aspects in the management and implementation of projects and works.  
13370. To analyze the multiple technical and legal conditions arising in the construction of public works, and use proven methods and proven technologies with the aim of achieving greater efficiency in construction while respecting the environment and protecting the safety and health of workers and users of public works.

##### Generical:

13360. To conceive, design, analyze and manage structures or structural elements of civil engineering or building, encouraging innovation and the advance of knowledge.  
13361. To develop, improve and use conventional materials and new construction techniques to ensure the safety requirements, functionality, durability and sustainability.  
13362. To define construction processes and methods of organization and management of projects and works.  
13363. To design plans for safety, quality and environmental and socioeconomic impacts related to the construction process.

#### TEACHING METHODOLOGY

---

The course consists of 3 hours per week of classroom activity (large size group).

The 3 hours in the large size groups are devoted to theoretical lectures, in which the teacher presents the basic concepts and topics of the subject, shows examples and solves exercises.

Support material in the form of a detailed teaching plan is provided using the virtual campus ATENEA: content, program of learning and assessment activities conducted and literature.

Classes are taught in Spanish but some activities and resources can be in English.

Although most of the sessions will be given in the language indicated, sessions supported by other occasional guest experts may be held in other languages.

## LEARNING OBJECTIVES OF THE SUBJECT

Subject to introduce the engineering in the field of environmental impact management in construction and bring it to the concept of sustainable construction.

- Knowledge of the basic concepts that make environmental principles an integral whole with complete lifecycle of structures and buildings . - Ability to quantify the environmental impact of building materials and waste thereof

Environmental concepts related to sustainable development. Environmental qualification systems . Life Cycle Analysis. Models TWIN BEDS , Eco - Cost / Value Ratio, Eco - Quantum, Eco-indicators . Flow analysis of building materials. Analysis of water flow . Bottlenecks. Solutions. Analysis of energy flow . Sustainable constructions . Objectives of the construction sector and its environmental consideration. Protection of soil and water. Waste, recycling and landfill.

The course aims to introduce the engineer within the field of construction environmental impacts management and sustainable construction. The course aims to provide the basic knowledge related to the life cycle impact of buildings taking into account raw materials consumption and waste management. It also aims to highlight the significance of energy consumption in buildings. This course also aims to provide students with the necessary knowledge on environmental management systems in construction companies and provide tools for assessing and monitoring the environmental impact of the construction sector.

## STUDY LOAD

Type	Hours	Percentage
Hours medium group	9,8	7.83
Hours small group	9,8	7.83
Hours large group	25,5	20.38
Self study	80,0	63.95

**Total learning time:** 125.1 h

## CONTENTS

### Environmental management of construction projects and sites

**Description:**

- Introduction to global environmental issues.
- Dimensions of sustainability in the construction industry.
- Concept of environmental impact
- Methodology and contents of the Environmental Impact Assessment
- Types, indicators and assessment of environmental impacts
- Analysis of the environment
- Prevention of the environmental impact
- Environmental monitoring program
- Communication of environmental impacts
- Introduction to Environmental Management Systems.
- Standards for Environmental Management Systems. UNE-ISO 14000 and Eco-Management and Audit Scheme System (EMAS).
- The implementation process of an Environmental Management System.
- Environmental Management System audits and verification / certification of the system.
- Integrated management systems.

Environmental management systems in construction companies - Case study

- The concept of Life Cycle Assessment
- Regulatory Framework
- Description of the methodology of Life Cycle Assessment

Life Cycle Analysis - Environmental Product Declaration

**Specific objectives:**

- To know the historical references and basic concepts related to sustainable development.
- To identify the building life cycle, agents and actions affecting the environment.
- To know the Environmental Impact Assessment methodology.
- To understand the basic aspects related to the implementation of environmental management systems in construction companies.
- To understand the basics of the methodology of Life Cycle Assessment

**Full-or-part-time:** 48h

Theory classes: 12h

Practical classes: 6h

Laboratory classes: 2h

Self study : 28h

### Construction material flow analysis

**Description:**

- Raw materials consumption
- Earthworks waste management
- Construction waste management
- Demolition waste management

**Specific objectives:**

- To understand the environmental impact related to the raw materials consumption and waste management in construction projects and sites and corresponding minimization strategies

**Full-or-part-time:** 28h 47m

Theory classes: 12h

Self study : 16h 47m

### Energy flow analysis in construction

**Description:**

- Energy consumption throughout the whole life cycle of the building
- Limitation of the energy demand in buildings
- Certification of the energy demand in buildings

Energy flow analysis in construction - Energy audit of a building

Presentation of the energy audit

**Specific objectives:**

- To understand the the environmental impact related to the energy consumption in construction projects and corresponding minimization strategies.

**Full-or-part-time:** 31h 12m

Theory classes: 7h

Practical classes: 3h

Laboratory classes: 3h

Self study : 18h 12m

### GRADING SYSTEM

The mark of the course is obtained through continuous assessment.

Continuous assessment consists in several activities, both individually and in group, of additive and training characteristics, carried out during the year (both in and out of the classroom).

The evaluation tests consist in questions about concepts related to the learning objectives of the course and a set of application exercises.

The final grade depends on the following assessment criteria:

- Activities (60%)
- Exam (40%)

### EXAMINATION RULES.

Failure to perform a continuous assessment activity in the scheduled period will result in a mark of zero in that activity.

### BIBLIOGRAPHY

**Basic:**

- Unión Europea. EMAS: Reglamento Comunitario de Ecogestión y Ecoauditoría [on line]. [Consultation: 28/04/2020].
