200243 - LF - Logic and Foundations

Degree competences to which the subject contributes

Specific:
3. CE-2. Solve problems in Mathematics, through basic calculation skills, taking in account tools availability and the constraints of time and resources.
4. CE-4. Have the ability to use computational tools as an aid to mathematical processes.

5. Ability to solve problems from academic, technical, financial and social fields through mathematical methods.

General:
1. CB-4. Have the ability to communicate their conclusions, and the knowledge and rationale underpinning these to specialist and non-specialist audiences clearly and unambiguously.
2. To have developed those learning skills necessary to undertake further interdisciplinary studies with a high degree of autonomy in scientific disciplines in which Mathematics have a significant role.
6. CG-1. Show knowledge and proficiency in the use of mathematical language.

7. CG-2. Construct rigorous proofs of some classical theorems in a variety of fields of Mathematics.

8. CG-3. Have the ability to define new mathematical objects in terms of others already know and ability to use these objects in different contexts.
9. CG-4. Translate into mathematical terms problems stated in non-mathematical language, and take advantage of this translation to solve them.
10. CG-6 Detect deficiencies in their own knowledge and pass them through critical reflection and choice of the best action to extend this knowledge.

Transversal:
11. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
12. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.

# Content

## 1. Introduction: The Hilbert program for the foundations of mathematics

**Learning time:** 1h
- Theory classes: 1h

## 2. Background: The transformation of mathematics in the 19th century

**Learning time:** 21h
- Theory classes: 11h
- Guided activities: 3h
- Self study: 7h

**Description:**
A. Mathematical objects.

B. The evolution of the method.
- Introduction: certainty of mathematical knowledge, the use of the axioms and language. The axiomatic method: from Greek deductive mathematics to Hilbert's conception. The emergence of symbolic logic: from sillogistics to the symbolic calculi of the end of 19th century.

## 3. Hilbert's program: context and development

**Learning time:** 70h
- Theory classes: 25h
- Guided activities: 10h
- Self study: 35h

**Description:**
A. Formulation: 1900-1921

B. Contributions: 1921-1936
- The completeness of logic: Gödel's theorem, compactness and Skolem's paradox. The decision problem: Notion of algorithm and the indecidability of first order logic. The incompleteness phenomenon and the necessity of a reformulation of Hilbert's program. Proofs of consistency: The extension of finitary methods and Gentzen's consistency proof for arithmetic.
The course grade (N) is obtained from:
* Delivery of exercises during the course (P) (they consist in a written brief discussion of a theme proposed by the teacher or in solving a problem), and
* A final exam (F).
Then, \( N = 0.4P + 0.6F \).
