Teaching methodology

The course is divided into parts:

- Theoretical and work group sessions
- Laboratory sessions

Self-study (including proposed exercises and activities) will be also contemplated.

In the theory classes, teachers will introduce the theoretical basis of the concepts, methods and results and illustrate them with examples appropriate to facilitate their understanding. Students, working in groups will use the new concepts to specify its solution in order to solve the proposed challenge.

In the lab sessions, teachers guide students in applying theoretical concepts to solve problems, always using critical reasoning.

Students, independently, need to work on the materials provided by teachers in order to fix and assimilate the concepts.

The teachers provide the syllabus and monitoring of activities (by ATENEA)

Learning objectives of the subject

This course is based on the practical development of a “hands-on” application on Safety Robotics and Automation under
Industry 4.0 specifications. The applications to be developed, will be proposed as real challenges from a leading company in the industrial security sector, and will be supervised by lecturers.

Depending on proposed challenges, applications will be developed by pairs or by groups and in both cases, teachers will assess and supervise each student’s teamwork in order to help them in the project development and to solve possible doubts.

• To acquire knowledge about Industry 4.0 and safety concepts and standards
• To acquire knowledge about industrial safety.
• To design safety automation
• To acquire knowledge about safety robotics.
