220022 - Structural Theory

Degree competences to which the subject contributes

Specific:
1. GrETA/GrEVA - An understanding of the behaviour of structures under stress in ordinary and extreme conditions.
2. GrETA/GrEVA - An adequate understanding of the following, as applied to engineering: principles of continuum mechanics and techniques for calculating response.

Teaching methodology

It is divided into three parts:
- Theory lessons where the basic concepts are developed. They took place in the classroom and it is used the expositive method.
- Exercises lessons, where the theoretical concepts are applied to the resolution of practical examples. It takes place in the classroom, in smaller groups than the ones of theory lessons.
- Laboratory practices, where, in reduced groups and in a guided way, the students get in contact with the experimental methodology

At the same time, it will be proposed the realization of problems and exercises, as well as the elaboration of a laboratory report that has to be made out of the class hours.

Learning objectives of the subject

Get the student to understand the behaviour of the structures and resistant structures and to be able of design a structure that is capable of support the efforts that the structures are brought under in good conditions, facing breaking and with deformations compatible with their functionality.
## Study load

### Qualification system

Laboratory practices: 10%
Partial exam: 30%
Final exam: 50%
Proposed activity 10%
It will be a method to recover unsatisfactory results in the partial exam.

### Regulations for carrying out activities

The laboratory practices along with the laboratory reports are mandatory to pass the subject.
