240604 - Identification and Simulation of Dynamic Systems

Coordinating unit: 240 - ETSEIB - Barcelona School of Industrial Engineering
Teaching unit: 707 - ESAII - Department of Automatic Control
Academic year: 2019
Degree: BACHELOR’S DEGREE IN MATERIALS ENGINEERING (Syllabus 2010). (Teaching unit Optional)
ECTS credits: 4,5
Teaching languages: Catalan, Spanish

Teaching staff

Coordinator: YOLANDA BOLEA MONTE
Others: MIGUEL ANGEL MAÑANAS VILLANUEVA - YOLANDA BOLEA MONTE

Opening hours

Timetable: Agreed with the professors by e-mail.

Prior skills

It is assumed that the students will have skills acquired in previous subjects related subjects in the degree study plan.

Requirements

Basic knowledge of system dynamics, automatic control, computer science and mathematical modelling (acquired in subjects like Mechanics, Electricity, ...).

Degree competences to which the subject contributes

Specific:
1. Capacity to analyse, design, simulating and optimising processes and products.

Transversal:
2. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
3. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
4. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

The course will be given by means of classes of theory/problems (2 hours per week) and by means of practical labs (2 hours per week).

In the theory/problems classes, professors will introduce basic concepts about the subject, that will allow students to complement with provided literature, and will present and solve problems/case studies.

Lab sessions will be organised in small groups of students (with a maximum of 20), where students will apply the concepts introduced in theory/problem classes using lab facilities in the provided case studies.
Learning objectives of the subject

To provide the students with the necessary tools for modeling and simulation of dynamic systems (chemical processes, robotic manipulators, bacteriological growth, ...) using physical models and experimental data. At the end of the course, the student has achieved the following specific objectives:
- Mathematical description of physical systems.
- Techniques of modeling and analysis of dynamic systems.
- Identification and parameterization of models from experimental data.
- Knowledge of simulation tools of dynamic systems and their use.

3. SIMULATION OF DYNAMIC SYSTEMS

**Description:**
- 3.1 Numerical methods for solving differential equations
- 3.2 Numerical integration methods
- 3.3 Tools for simulating dynamic systems
- 3.4 Model validation
- 3.5 Anàlisis de validesa dels models
- 3.6 Exemples

**Related activities:**
Classes of theory/problems

**Specific objectives:**
In this chapter, methods and tools for numerical simulation of dynamic systems will be introduced.

Learning time: **13h**
- Theory classes: 9h
- Practical classes: 4h

4. IDENTIFICATION OF DYNAMIC SYSTEMS

**Description:**
- 4.1 Input signals
- 4.2 Non-parametric methods in the time domain
- 4.3 Non-parametric methods in the frequency domain
- 4.4 Parametric methods
- 4.5 Least-squares method
- 4.6 Output error method
- 4.7 Prediction error method
- 4.8 Instrument variable method
- 4.9 Recursive methods
- 4.10 Model structure selection and validation
- 4.11 Practical aspects

**Related activities:**
Theory/problem classes

**Specific objectives:**
In this chapter, system identification methods that allow to obtain the model structure and parameters from experimental data are presented.

Learning time: **14h**
- Theory classes: 10h
- Laboratory classes: 4h
# Planning of activities

## LAB 1: NUMERICAL SIMULATION TOOLS

**Hours:** 2h  
Laboratory classes: 2h

**Description:**
Introduction to the numerical simulation tools typically used in engineering.

**Support materials:**  
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**  
Report

**Specific objectives:**  
To know how to use the numerical simulations tools typically used in engineering

## LAB 2: MODELLING OF DYNAMIC SYSTEMS

**Hours:** 2h  
Laboratory classes: 2h

**Description:**
In this lab activity, students will learn about generic modelling methodologies for dynamic systems

**Support materials:**  
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**  
Report

**Specific objectives:**  
To learn to model dynamic systems appearing in engineering applications using generic modelling methodologies.

## LAB 3: SIMULATION OF AUTOMATIC CONTROL SYSTEMS

**Hours:** 2h  
Laboratory classes: 2h

**Description:**
In this lab, students will simulate automatic control systems already designed.

**Support materials:**  
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**  
Report

**Specific objectives:**  
To learn to simulate systems including automatic control loops.

## LAB 4: SYSTEM IDENTIFICATION (I)

**Hours:** 2h  
Laboratory classes: 2h

**Description:**
In this lab, students will apply methods of system identification to experimental data obtained from a system.
LAB 5: SYSTEM IDENTIFICATION (II)  
**Hours:** 2h  
Laboratory classes: 2h

**Description:**  
In this lab, students will continue Lab 4 by applying other system identification methods.

**Support materials:**  
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**  
Report

**Specific objectives:**  
To learn to identify system models from experimental data.

LAB 6: SIMULATION MINIPROJECT  
**Hours:** 4h  
Laboratory classes: 4h

**Description:**  
In this lab, students will work on a case study where different methodologies of modelling, identification and simulation studied in the course will be applied.

**Support materials:**  
MATLAB/SIMULINK

**Descriptions of the assignments due and their relation to the assessment:**  
Report

**Specific objectives:**  
The objective of this miniproject is that student understand the role that the different methodologies presented in the course play when dealing with a real system.

Qualification system

The evaluation will be realized by means of  
- partial exam (35% of the subject mark)  
- final exam (45 % of the subject mark)  
- lab reports (20% of the subject mark)
Regulations for carrying out activities

The exam will be realized of individual form with the authorized supporting material and in the dates established in the academic calendar of the School.
