Degree competences to which the subject contributes

Specific:
CT1.2A. To interpret, select and value concepts, theories, uses and technological developments related to computer science and its application derived from the needed fundamentals of mathematics, statistics and physics. Capacity to solve the mathematical problems presented in engineering. Talent to apply the knowledge about: algebra, differential and integral calculus and numeric methods; statistics and optimization.

CT1.2C. To use properly theories, procedures and tools in the professional development of the informatics engineering in all its fields (specification, design, implementation, deployment and products evaluation) demonstrating the comprehension of the adopted compromises in the design decisions.

Generical:
G9. PROPER THINKING HABITS: capacity of critical, logical and mathematical reasoning. Capacity to solve problems in her study area. Abstraction capacity: capacity to create and use models that reflect real situations. Capacity to design and perform simple experiments and analyse and interpret its results. Analysis, synthesis and evaluation capacity.
270007 - M1 - Mathematics I

Teaching methodology

In the theory classes the teacher explains the subject accompanying it with some examples and solving problems of the list.

During the practical classes students solve problems under the supervision of the teacher; some of these problems must be prepared prior to the class.

Learning objectives of the subject

1. To know and understand the concept of graph as a model of a binary relationship. To be able to work with different representations of a graph, in particular, finding the main parameters of a graph and deciding whether two given graphs are isomorphic.

2. To know the definitions concerning walks, connectivity and distance in graphs, and being able to work with these concepts and their relationships, at the theoretical and practical level. To understand and apply algorithms to determine whether a graph is connected and to compute distances in graphs.

3. To know the concepts of Eulerian and Hamiltonian graph, and to be able to decide if a graph is Eulerian or Hamiltonian. To be aware that these two problems look very similar but are very different from the theoretical and computational point of views.

4. To know what a tree is and to be able to work with its different equivalent definitions. To understand the concept of a spanning tree and its relationship to connectivity. To know and apply algorithms to find a spanning tree. To know how to codify a tree with a Prüfer sequence.

5. To know how to perform matrix operations. To know the elementary matrix transformations (by rows), and to use them to find the rank of a matrix and to decide whether a matrix is invertible. To know the basic properties of determinants, and how to apply them to simplify computations.

6. To understand and apply Gauss-Jordan elimination to discuss and solve linear systems, and to calculate the inverse of a matrix.

7. To know and understand the concepts of a vector space, of subspace, linear dependence and independence, and basis. To be able to prove basic properties about these concepts and their relationships.

8. To know how to do computations in a vector space, that is, to be able to work in practice with the concepts of vector subspace, linear combination, generators, linear dependence and bases. To know how to find the matrix of a change of basis.

9. To know and understand the concepts of linear map, kernel, image, isomorphism, endomorphism. To be able to prove basic properties involving these concepts and their relationships.

10. To be able to decide whether a map is linear. To work in practice with the concepts of kernel, image, endomorphism and isomorphism. To know how to find the matrix associated to a linear map in in a basis.

11. To know what are eigenvalues, eigenvectors and the characteristic polynomial of an endomorphism. To be able to prove basic properties concerning the concepts above. To discuss whether an endomorphism is diagonalisable or not.

# Content

## Basic concepts of graphs

**Degree competences to which the content contributes:**

**Description:**
Definition of graph, adjacency and incidence matrices, the handshake lemma and its consequences; isomorphism of graphs; families of graphs, subgraphs, graph operations.

## Walks, connectivity and distance

**Degree competences to which the content contributes:**

**Description:**
Definitions of walk, cycle, path; some properties of walks; definition of connected graph and connected components; DFS algorithm; inequality $m \geq n-1$; definitions of cut vertices and bridges, and their characterization; 2-connected graphs; definitions of distance and diameter; BFS algorithm; characterization of bipartite graphs.

## Eulerian and Hamiltonian graphs

**Degree competences to which the content contributes:**

**Description:**
Definitions of Eulerian circuit, trail and graph; characterization of Eulerian graphs; definition of Hamiltonian cycle, path and graph; necessary conditions for being Hamiltonian; the theorems of Dirac and Ore.

## Trees

**Degree competences to which the content contributes:**

**Description:**
Definitions of forest, tree and leaf; equivalent characterizations and their corollaries; definition of spanning tree; review of DFS and BFS; Cayle's theorem.

## Matrices and systems of linear equations

**Degree competences to which the content contributes:**

**Description:**
Definition of matrix, families of matrices; linear operations and their properties; product of matrices and matrix inverse; matrix transpose and relationship to the operations; elementary row transformations, elementary matrices, row-echelon form; rank of a matrix; computing the matrix inverse; systems of linear equations, equivalent systems; discussion and solution using Gauss-Jordan; recursive definition of determinant, properties of determinants, minors of a matrix and relationship to the rank.
**Vector Spaces**

**Degree competences to which the content contributes:**

**Description:**
Definition of vector space; definition of subspace and its equivalent characterization; subspace spanned by a set of vectors, linear combinations, systems of generators; linear independence and its properties; bases and coordinates; dimension; basis changes and the change of basis matrix.

**Linear maps**

**Degree competences to which the content contributes:**

**Description:**
Definition of linear map and basic properties; linear map defined by a matrix; matrix of a linear map; kernel and image, the dimension theorem; characterization of one-to-one and onto linear maps; isomorphism of vector spaces, isomorphic spaces; composition of maps; change of basis; geometric interpretation of linear maps on the plane and the space.

**Diagonalization**

**Degree competences to which the content contributes:**

**Description:**
Eigenvalues and eigenvectors; diagonalization of endomorphisms; symmetric matrices.
# Planning of activities

**Description:**
Theory and practice of Chapter 6 of the syllabus.

**Specific objectives:**
7, 8

**Linear maps and diagonalization**  
**Hours:** 37h 30m  
Theory classes: 9h  
Practical classes: 0h  
Laboratory classes: 6h  
Guided activities: 1h 30m  
Self study: 21h

**Description:**
Theory and practice of Chapters 7 and 8 of the syllabus.

**Specific objectives:**
9, 10, 11

**Exam about the first part of the course (theory and problems)**  
**Hours:** 0h  
Guided activities: 0h  
Self study: 0h

**Description:**
The goals 1-4 will be evaluated.

**Specific objectives:**
1, 2, 3, 4

**Final exam for the course (theory and problems)**  
**Hours:** 0h  
Guided activities: 0h  
Self study: 0h

**Description:**
The exam will have two parts. In the first (F1) the course objectives 1-4 will be evaluated, and in the second (F2), the objectives 5-11.

**Specific objectives:**
1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11
Qualification system

The grade for the course will be obtained from:

- a mid-term exam P, on the first part of the syllabus;
- the T valuation of work and achievement of objectives of the practical sessions,
- a final exam F, which will have two parts, F1 and F2.

The grade on the evaluation report will be:

\[ 0.2 \times T + 0.35 \times \max(P, F1) \times F2 + 0.45 \]

Students who wish to take the exam F1 will have to let this know to the coordinator of the course (the deadline for doing so will be announced accordingly).

The grade NP will be given to those students not showing up at any of the tests of the part corresponding to items 5, 6, 7, 8 in the syllabus.

There will be a part of the examination devoted to the evaluation of generic competition.
