270216 - IPA - Introduction to Audiovisual Processing

Coordinating unit: 270 - FIB - Barcelona School of Informatics
Teaching unit: 739 - TSC - Department of Signal Theory and Communications
Academic year: 2019
Degree: BACHELOR'S DEGREE IN DATA SCIENCE AND ENGINEERING (Syllabus 2017). (Teaching unit Compulsory)
ECTS credits: 6  Teaching languages: Catalan

Degree competences to which the subject contributes

Basic:
CB5. That the students have developed those learning skills necessary to undertake later studies with a high degree of autonomy

Specific:
CE5. Design and apply techniques of signal processing, choosing between different technological tools, including those of Artificial vision, speech recognition and multimedia data processing.

General:
CG1. To design computer systems that integrate data of provenances and very diverse forms, create with them mathematical models, reason on these models and act accordingly, learning from experience.
CG2. Choose and apply the most appropriate methods and techniques to a problem defined by data that represents a challenge for its volume, speed, variety or heterogeneity, including computer, mathematical, statistical and signal processing methods.
CG5. To be able to draw on fundamental knowledge and sound work methodologies acquired during the studies to adapt to the new technological scenarios of the future.

Transversal:
CT6. Autonomous Learning. Detect deficiencies in one's own knowledge and overcome them through critical reflection and the choice of the best action to extend this knowledge.

Teaching methodology
The subject is based on classroom theory classes, problems and laboratory. The theory classes follow the program defined in this teaching guide. Within the lectures, the dialogue between professors and students is promoted by proposing exercises and activities to be carried out jointly based on particular aspects of the topic being dealt with. The laboratory classes exemplify the contents developed in the theory classes.

Learning objectives of the subject
1. Know how to characterize stochastic processes
2. Understand and know how to use the most common signal transforms and their application
3. To obtain basic optimal and adaptive filtering background for audiovisual data applications

Content

Statistical Signal modelling

Degree competences to which the content contributes:

Description:

Estimation Theory

Degree competences to which the content contributes:

Description:
(1) Parameter Estimation: Concept, quality measures and types of estimators
(2) Function estimators: Autocorrelation and Power Density Espectral estimation

Transforms

Degree competences to which the content contributes:

Description:
Frequency analysis: (1) Discrete Cosinus transform (DCT), (2) Short-time Fourier Transform. Interpretation as a filter bank. Window effect. Reconstruction. Spectrogram.

Optimal filter and adaptive filter

Degree competences to which the content contributes:

Description:
## Planning of activities

Qualification system

The final mark is obtained from the partial marks:

- Mid-term exam: M (25%)
- Final exam: F (60%)
- Laboratory assignments: L (15%)

Mark = max (0.6F+0.25M+0.15L ; 0.85F+0.15L)

In the case of a re-evaluation exam (R), the final mark is

Mark = 0.85R+0.15L
