270218 - PSD - Parallelism and Distributed Systems

Coordinating unit: 270 - FIB - Barcelona School of Informatics
Teaching unit: 701 - DAC - Department of Computer Architecture
Academic year: 2019
Degree: BACHELOR'S DEGREE IN DATA SCIENCE AND ENGINEERING (Syllabus 2017). (Teaching unit Compulsory)
ECTS credits: 6
Teaching languages: Catalan

Prior skills

C and Python are the programming language of choice for the labs sessions of this course. It is assumed that the student has a basic knowledge of Python and C prior to starting classes.

Degree competences to which the subject contributes

Basic:
CB1. That students have demonstrated to possess and understand knowledge in an area of study that starts from the base of general secondary education, and is usually found at a level that, although supported by advanced textbooks, also includes some aspects that imply knowledge from the vanguard of their field of study.
CB2. That the students know how to apply their knowledge to their work or vocation in a professional way and possess the skills that are usually demonstrated through the elaboration and defense of arguments and problem solving within their area of study.
CB5. That the students have developed those learning skills necessary to undertake later studies with a high degree of autonomy.

Specific:
CE4. Use current computer systems, including high performance systems, for the process of large volumes of data from the knowledge of its structure, operation and particularities.

Generalical:
CG1. To design computer systems that integrate data of provenances and very diverse forms, create with them mathematical models, reason on these models and act accordingly, learning from experience.
CG2. Choose and apply the most appropriate methods and techniques to a problem defined by data that represents a challenge for its volume, speed, variety or heterogeneity, including computer, mathematical, statistical and signal processing methods.
CG4. Identify opportunities for innovative data-driven applications in evolving technological environments.

Transversal:
CT4. Teamwork. Be able to work as a member of an interdisciplinary team, either as a member or conducting management tasks, with the aim of contributing to develop projects with pragmatism and a sense of responsibility, taking commitments taking into account available resources.
CT5. Solvent use of information resources. Manage the acquisition, structuring, analysis and visualization of data and information in the field of specialty and critically evaluate the results of such management.
CT6. Autonomous Learning. Detect deficiencies in one's own knowledge and overcome them through critical reflection and the choice of the best action to extend this knowledge.
CT7. Third language. Know a third language, preferably English, with an adequate oral and written level and in line with the needs of graduates.
270218 - PSD - Parallelism and Distributed Systems

Teaching methodology

During the course there will be four types of activities:

a) Activities aimed at acquiring theoretical knowledge. Theoretical activities include participatory classes, which explain the basic contents of the course.

b) The activities focused on acquiring knowledge through experimentation using the "learn to do" approach in practice-guided laboratory sessions (and final report). Some sessions may include pre-work or post-session work depending on the use of laboratories.

c) Few sessions during the theory classes where practical exercises will be performed to perform numerical evaluations and analysis for performance evaluation.

d) Two reports of exercises to be performed in laboratories related to HPC environments and applications and data analysis environments

Learning objectives of the subject

1. Conèixer els fonaments dels sistemes paral·lels i distribuïts actuals
2. Coneixer i saber usar els elements bàsics que conformen els sistemes paral·lels i distribuïts
3. Familiaritzar-se amb els models de programació més habituals dels sistemes paral·lels i distribuïts
4. Conèixer i poder triar convenientment quin els entorns d’analítica avançada que usen sistemes distribuïts i parallel
5. Us pràctic per diferents problemes plantejats dels entorns cloud, sistemes paral·lels i distribuïts disponibles actualment per a un enginyer i científic de dades

# 270218 - PSD - Parallelism and Distributed Systems

## Content

### Foundations of parallel and distributed supercomputing

**Degree competences to which the content contributes:**

**Description:**
In this topic, students will learn basic concepts of parallel computing as well as metrics that will help them evaluate both the performance of their programs and the limits derived from the application structure itself.

### Parallel and distributed architectures

**Degree competences to which the content contributes:**

**Description:**
In this topic, students will learn the main characteristics of the parallel and distributed architectures that can most influence them when designing their data analysis programs or to understand the performance (or loss of performance) of them.

### Execution environments for parallel computing and data analytics

**Degree competences to which the content contributes:**

**Description:**
In this topic, students will learn about the different environments that can be found mainly when executing so many applications to generate data such as those stored or analyzed. Emphasis will be placed on the differences between the three environments and their impact on the efficiency of their applications.

### Programming models for supercomputers

**Degree competences to which the content contributes:**

**Description:**
In this topic, the students will see the basic principles of the most used programming models in the HPC environments: MPI, OpenMP and hybrid MPI OpenMP models. The tools will be given to detect and manage the main details that may affect both the robustness of their programs and their efficiency. Co-processor oriented models that offer good performance vs. efficiency will also be introduced. Energy consumption and very used in the analysis of data.

### Software and execution environment specific for advanced analytics

**Degree competences to which the content contributes:**

**Description:**
In this topic, the students will see in more detail the characteristics of the programming models and execution environments for storage and data analysis. The Apache Spark / Hadoop model will be used as a reference, as a reference for Cassandra data storage and as TensorFlow / keras analysis tools.
Powering Machine Learning with supercomputers: Case Study with Spark/ Cassandra/ TensorFlow

Degree competences to which the content contributes:

Description:
In this subject, you will learn in a machine learning environment using the Apache Spark model, with DB key / value Cassandra and analysis TensorFlow. S'explicaran the elements més importants d'aquests tres components que poden afectar en major mesura a la concepció d'aplicacions de màquina learning amb l'emmagatzematge de dades i analitz.

Lab sessions

Degree competences to which the content contributes:

Description:
The laboratory sessions will be grouped into two projects that will be carried out both in the laboratory sessions and in autonomous work. The two projects will be related to the programming, analysis and optimization of a case as realistic as possible in two environments: parallel execution environments (mpi OpenMP, queue systems, etc.) used to generate and post-process data, and specific management and data analysis environments such as Apache Stark Cassandra TensorFlow.
## Planning of activities

</table>

**Description:**
In this topic, students learn the main features of parallel and distributed architectures that can influence the design of their data analysis programs and understand the performance (or loss of performance) of these: They will be seen, for example features of systems with multi-core architecture, hyperthreading, shared-distributed memory, local time-space data, type of storage (local, remote), typology networks, etc.

**Specific objectives:**
1, 2

### Description:
In this topic, students will learn about the different environments that can be found mainly when executing so many applications to generate data such as those stored or analyzed. Emphasis will be placed on the differences between the three environments and their impact on the efficiency of their applications. Running environment with queues for HPC, cloud computing for DA. During this topic, it will be divided into HPC environments and data analysis environments (DAs). Problems will also be exercised during theory classes.

### Specific objectives:
2, 4

<td>Self study: 28h</td>
</tr>
</tbody>
</table>

**Description:**
During the lab exercises will be proposed that will be done most during the classes. Some of these exercises will aim at practicing specific aspects of both more traditional HPC and data analytics environments. Others will be part of a larger exercise over the course of sessions. There will be two exercises: one for the most HPC and one more specific for data analysis environments. It will first be delivered just after the end of sessions dedicated to HPC environments and applications. The second just after the data analysis environment sessions are over.

**Specific objectives:**
2, 3, 4, 5

**Qualification system**
The evaluation of the subject will come out of three components:

- Partial exam: 40%
- Final exam: 40%
- Laboratory: 20%.

The lab grade will come from the evaluation of the lab deliverables
First partial exam will eliminate the material from Final exam (if mark >= 5.0)
The final grade is computed: 0.2*lab+0.4*final exam + 0.4*Partial exam

In case the grade is less than 5.0, student will be allowed to do the reevaluation exam. In that case, the grade will be computed as:

Final Note: Max(Revaluation Exam * 0.8, Partial exam * 0.4 + Final Exam * 0.4) + Laboratory * 0.2
