**Teaching methodology**

- Lectures presenting content.
- Face-to-face sessions of practical work.
- Independent work study and conducting exercises.
- Preparation and implementation of individual and/or group activities.

In the sessions of explanatory content teacher introduce the theoretical foundations of the subject, concepts, methods and illustrated with suitable examples to facilitate understanding results. The students will independently study to assimilate the concepts, solve exercises either manually or with the help of computer.

Students will become familiar in the use of a mathematical software package in order to use it as a tool for numerical, symbolic and graphic calculation.

**Learning objectives of the subject**

Students will have to consolidate the fundamental concepts of differential and integral calculus in several variables, in their analytical and numerical aspects. While it will have to acquire some knowledge of the usual techniques of manipulation and calculation, using support tools will be enhanced: he's familiar with the use of a mathematical software package in order to use it as a calculation tool numeric, symbolic and graphic.

It is also intended that students come into contact with the techniques of numerical solution of problems, in this case, in the context of the problems of the calculus.

Qualification system

The evaluation of the course will be partial evaluations by the following weights:
- Midterm exams: 70% (First exam: 25%, Second exam: 45%)
- Laboratory: 20%
- Tasks: 10%

Re-evaluation: when an student does not reach the global minimum qualification, he/she can do an extra exam only if he/she reaches 3.5 of both midterm exams. Then, the total qualification can be 5.0 as maximum.

Regulations for carrying out activities

Assessments consist of acts of classroom and other activities that are part of the continuous assessment. If the student does not realize any of these activities, the qualification shall be considered as zero.
