3200211 - ME1 - Electrical Machines I

Coordinating unit: 205 - ESEIAAT - Terrassa School of Industrial, Aerospace and Audiovisual Engineering
Teaching unit: 709 - EE - Department of Electrical Engineering
Academic year: 2017
Degree: BACHELOR'S DEGREE IN ELECTRICAL ENGINEERING (Syllabus 2009). (Teaching unit Compulsory)
ECTS credits: 6
Teaching languages: Catalan, Spanish

Teaching staff
Coordinator: Ricard Horta Bernús

Prior skills
Students will be expected to have passed Physics and Electrical Systems, since the knowledge acquired in those subjects is the foundation on which an understanding of electric machines will be built.

Degree competences to which the subject contributes

Specific:
1. ELE: Ability to calculate and design electrical machines.

Teaching methodology

In the lecture sessions, the lecturer presents the subject content. He/she covers the various concepts, explains what documentation will be used and assigns work.
In the face-to-face applied sessions, groups of three students present the results of their completed assignments. The lecturer decides which students will participate in each of these sessions.
Independent learning enables students to gain an understanding of each of the concepts covered by the lecturer. This type of learning also includes the completion of assignments.
Group work, done in three-person teams, includes preparation for practicals and the writing of post-practical reports.

Learning objectives of the subject

This subject introduces students to the operation, construction, application and selection principles of electric machines (both static and rotating), as well as the design of basic parts that are common to all such machines. Students will learn to use the parameters that govern the various types of machines and interpret their characteristic curves. They will use commercial catalogues and rated quantities to determine the performance of different machines and select the most appropriate one. They will also learn to interpret and use graphic methods, recommended by international standards, for construction, use and start-up tests.
Students will learn to solve problems related to the behaviour of electric machines (generators, transformers and engines) both analytically and graphically, paying special attention to the order of magnitude and the units used in industry. They will use construction plans and diagrams to better understand the operation and configuration of the various circuits (magnetic, electric, dialectic, etc.) and their topology.

### Content

#### TOPIC 0: INTRODUCTION

**Description:**
- 0.1. Background on electric machines. Documentation.
- 0.2. General information on electric machines.

**Learning time:** 4h
- Theory classes: 3h
- Guided activities: 1h

#### TOPIC 1: SYNCHRONOUS alternating-current machines

**Description:**
- 1.01. Basics of synchronous machines.
- 1.02. Characteristics of synchronous machines.
- 1.03. Excitation and voltage drops.
- 1.04. Alternator coupling.
- 1.05. Synchronous engines.
- 1.06. Additional topics.

**Related activities:**
- Two sessions.
- Testing of synchronous generators to obtain their characteristic parameters and equivalent circuit.
- Parallel coupling of synchronous generators and network connections.

**Learning time:** 31h
- Theory classes: 18h
- Practical classes: 6h
- Laboratory classes: 4h
- Guided activities: 3h
## TOPIC 2: TRANSFORMERS

### Learning time: 49h
- Theory classes: 30h
- Practical classes: 10h
- Laboratory classes: 6h
- Guided activities: 3h

### Description:
- 2.01. Basic principles of transformers.
- 2.02. The study of real transformers.
- 2.03. Equivalent circuits in transformers.
- 2.05. Polyphase transformers.
- 2.06. Transformer coupling.
- 2.07. Autotransformers.
- 2.08. Measurement transformers.
- 2.09. Special transformers.
- 2.10. Additional topics.

### Related activities:
- Three sessions.
- Testing of single-phase transformers to obtain their characteristic parameters and equivalent circuit.
- Testing of three-phase transformers to obtain their characteristic parameters and equivalent circuit.
- Students use current and voltage transformers to take measurements.
- Paralleling of single-phase and three-phase transformers.
- Determination of transformer winding polarity.

### Qualification system
- Exam 1: 20%
- Exam 2: 10%
- Exam 3: 20%
- Exam 4: 10%
- Exam laboratory: 10%
- Delivery 1: 10%
- Delivery 2: 10%
- Deliveries laboratory: 10%
