1. SELF-DIRECTED LEARNING - Level 3. Applying the knowledge gained in completing a task according to its relevance and importance. Deciding how to carry out a task, the amount of time to be devoted to it and the most suitable information sources.
2. TEAMWORK - Level 3. Managing and making work groups effective. Resolving possible conflicts, valuing working with others, assessing the effectiveness of a team and presenting the final results.

### TEACHING METHODOLOGY

---

- Lectures
- Practical work sessions
- Autonomous work: theory and practice
- Preparation and realisation of course activities, both in groups and individually

## LEARNING OBJECTIVES OF THE SUBJECT

The main objective in this assignature is to capacitate students to comprehend and to apply the so called Finite Elements Method. Most engineering problems are modelled through partial differential equations to be approximately solved by using FEM techniques. After the numerical method issues obtained at Matemàtiques I, our students are supposed to go deeper through them in order to solve mathematical problems and also, in order to be prepared to the introduction and use of the FEM.

A practical approach is to be applied, with a pretty wide sort of applications of the FEM to different engineering problems to be treated.

Development of our students' skills in the use either symbolic, programming and commercial software is also pretended. In particular MATLAB and ANSYS are packages to be used.
