Learning objectives of the subject

320029 - MEFPE - Numerical Methods for Engineers

The main objective in this signature is to capacitate students to comprehend and to apply the so called Finite Elements Method. Most engineering problems are modelled through partial differential equations to be approximately solved by using FEM techniques.

After the numerical method issues obtained at Matemàtiques I, our students are supposed to go deeper through them in order to solve mathematical problems and also, in order to be prepared to the introduction and use of the FEM.

A practical approach is to be applied, with a pretty wide sort of applications of the FEM to different engineering problems to be treated.

Development of our students' skills in the use either symbolic, programming and commercial software is also pretended. In particular MATLAB and ANSYS are packages to be used.
