Degree competences to which the subject contributes

Specific:
1. Programming tools for solving problems related to engineering and bioprocesses.
2. Biological models and determination of their main properties.

General:
3. Ability to solve problems. LEVEL 3

Learning objectives of the subject

The programming and problem solving course will follow general training objectives, building students' skills in learning and promoting attitudes for assessment, suitability and usefulness of models, algorithms, computer procedures and diverse programs. Essentially, the course provides the students with fundamental knowledge of programming, some basic tools in the use of specific programs, and some computer skills as a help to tackle problems in the field of biosystems engineering.

Taking full advantage of the matter, the students should
- Identify the decisive events in the history of computing to become aware of the evolution of computers and programming up to the current situation.
- Know, understand and use the basic concepts and principles of programming, algorithms, structures and types of variables.
- Be able to design simple algorithms, know how to write the corresponding pseudocodes, and draw the adequate flowcharts.
- Know and understand the software development cycle from specification or statement of the problem, going through the intermediate steps (processing scheme, design of the algorithm, and writing the code) to achieve the execution, and
the debugging mechanisms of algorithms and programs.
- Acquire the basics of structured traditional imperative programming and identify the elements that characterize the object-oriented programming to compare them.
- Know the basic elements of the syntactic structure and semantics of a programming language (Basic, Fortran or other) to be able to translate simple algorithmic designs.
- Use a spreadsheet (Excel or other) and a mathematical software (Maple or some other) for the approach and treatment of problems in biosystems engineering, as well as for analytical or numerical resolution.
- Become familiar with NetLogo, a multi-agent programming language, in order to handle a set of simulators with appropriate criteria.
- Understand and modify programs already developed in this NetLogo framework, as well as create their own simulation programs for research in various biological systems.

Specific software to tackle the problem solving

Learning time: 50h
- Theory classes: 13h
- Laboratory classes: 7h
- Self study: 30h

Description:
Spreadsheet (Excel or other), their complements (or options) and programming for solving problems.
Mathematical software (Maple or other) with their libraries to address numerical, algebraic analysis of problems.
The platform free access software Netlogo: analysis, modification and implementation of the computational models implemented, and the creation of new programs for research and problem solving that require the formulation of discrete models.
Problem solving that requires the use of probability, arrays, continuous functions, discrete functions, optimization, linear programming, difference equations, and ordinary differential equations among other options.
Contextualization of problems applied to biosystems engineering, using different computational environments to identify the strategy for the resolution and using the appropriate software for their execution.

</tbody>
</table>
**Descriptions of the assignments due and their relation to the assessment:**
In the framework of this activity the generic competences are evaluated.

**Specific objectives:**
At the end of this activity students should be able to cover the different stages to achieve a simulator that responds to a specific problem, organizing information regarding the problem, choosing the right software, designing and implementing different parts of the code, and analyzing the simulation results.

---

**Qualification system**

N1: The continuous assessment will mainly be developed in the context of small groups or computer lab sessions, with problem solving and exercises.

N2: Weighted average of the individual written exams P1, P2 and PF (weight 0.25 for both tests during the semester P1 and P2, and 0.50 weight for the final exam PF).

CG: Generic competence. Evaluation of Activity 4, final project.

NFinal = 0.25 N1 + 0.55 N2 + 0.20 CG
