200603 - PIPE - Probability and Stochastic Processes

Coordinating unit: 200 - FME - School of Mathematics and Statistics
Teaching unit: 749 - MAT - Department of Mathematics
Academic year: 2018
Degree: MASTER'S DEGREE IN STATISTICS AND OPERATIONS RESEARCH (Syllabus 2013). (Teaching unit Optional)
ECTS credits: 5
Teaching languages: English

Teaching staff
Coordinator: JOSE FABREGA CANUDAS
Others: Segon quadrimestre:
         JOSE FABREGA CANUDAS - A

Prior skills
Students should be familiar with the topics covered in a first undergraduate course on probability. In particular, basic knowledge of the following subjects is assumed:

- Elementary probability theory.
- Basic probability models: binomial, geometric, Poisson, uniform, exponential, and normal distributions.

Concepts necessary to follow the course can be found, for example, in the following references:

- C.M Grinstead and J.L. Snell, Introduction to Probability (chap. 1-7),

Degree competences to which the subject contributes

Specific:
2. CE-2. Ability to master the proper terminology in a field that is necessary to apply statistical or operations research models and methods to solve real problems.
3. CE-3. Ability to formulate, analyze and validate models applicable to practical problems. Ability to select the method and / or statistical or operations research technique more appropriate to apply this model to the situation or problem.

Transversal:
1. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.
200603 - PIPE - Probability and Stochastic Processes

**Teaching methodology**

Weekly class hours combine both theoretical and practical sessions. The theoretical lectures are devoted to a careful presentation of the fundamental concepts and the main results which are illustrated with examples. Some mathematical proofs are presented which, for their content and development, are particularly interesting from the learning and creative point of view. In the practical sessions the solution of a variety of exercises and problems is discussed.

Lists of exercises as well as guided work could be assigned to be carried out individually or in groups.

**Learning objectives of the subject**

The general aim of the course is to introduce the students to modelling of random phenomena. The course focus on stochastic convergence problems that are crucial to statistics (laws of large numbers and central limit theorem) as well as on random processes (branching processes, random walks, Markov chains, the Poisson process). Tools related to transform methods (generating and characteristic functions) are also introduced. Special attention is given to the study of specific applications of the theoretical concepts.

Skills to be learned:

- Usage of probability and moment generating functions, and characteristic functions.
- To know the multivariate normal law and how to operate with jointly gaussian random variables.
- To understand the different modes of convergence of sequences of random variables as well as the precise meaning of the laws of large numbers and the central limit theorem.
- Basic concepts on stochastic processes.
- To work with Markov chains and the meaning of both stationary distributions and egodic theorems.
- To understand the Poisson process.
- To identify probability models based on the theoretical results presented in the course.

## 1. Generating Functions and Characteristic Function

**Learning time:** 14h 30m  
Theory classes: 3h  
Laboratory classes: 1h 30m  
Self study: 10h

### Description:
1.1 Probability and moment generating functions.  
1.2 The characteristic function.  
1.3 Sum of a random number of independent random variables.  
1.4 Distributions with random parameters.  
1.5 Application to the sample mean and sample variance.

## 2. Branching Processes

**Learning time:** 11h  
Theory classes: 1h 30m  
Laboratory classes: 1h 30m  
Self study: 8h

### Description:
2.1 The Galton-Watson process.  
2.2 Application to population growth.  
2.3 Probability of ultimate extinction.  
2.4 Probability generating function of the n-th generation.

## 3. The Multivariate Gaussian Distribution

**Learning time:** 16h  
Theory classes: 4h 30m  
Laboratory classes: 1h 30m  
Self study: 10h

### Description:
3.1 Joint characteristic function of independent gaussian random variables.  
3.2 The multidimensional gaussian law.  
3.3 Linear transformations.  
3.4 Lineal dependence and singular gaussian distributions.  
3.5 Multidimensional gaussian density.
### 4. Sequences of Random Variables

<table>
<thead>
<tr>
<th>Description:</th>
<th>Learning time: 17h 30m</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1 The weak law of large numbers. Convergence in probability.</td>
<td>Theory classes: 4h 30m</td>
</tr>
<tr>
<td>4.2 The central limit theorem. Convergence in distribution.</td>

<tr>
<td>7.6 Application to Montecarlo methods.</td>
<td></td>
</tr>
</tbody>
</table>
8. The Poisson Process

**Learning time:** 25h
- Theory classes: 6h
- Laboratory classes: 3h
- Self study: 16h

**Description:**
- 8.1 The Poisson process.
- 8.2 Intertransition times.
- 8.3 Birth and death processes.
- 8.4 Continuous time Markov chains.

**Qualification system**

The final grade (NF) will be calculated in the following manner:

\[ NF = \max(\text{EF}, 0.4*\text{EF} + 0.4*\text{EP} + 0.2*\text{T}) \]

where EF is the final exam mark, EP is the partial exam mark and T is the mark of the exercises and assigned work throughout the course.
