200617 - PE - Stochastic Optimization

**Coordinating unit:** 200 - FME - School of Mathematics and Statistics  
**Teaching unit:** 715 - EIO - Department of Statistics and Operations Research  
**Academic year:** 2018  
**Degree:** MASTER'S DEGREE IN STATISTICS AND OPERATIONS RESEARCH (Syllabus 2013). (Teaching unit Optional)  
**ECTS credits:** 5  
**Teaching languages:** English

### Teaching staff

**Coordinator:** JORDI CASTRO PÉREZ  
**Others:** Segon quadriemestre:  
JORDI CASTRO PÉREZ - A  
FRANCISCO JAVIER HEREDIA CERVERA - A

### Prior skills

Basic knowledge of Operations Research / Optimization / Mathematical Programming and Modelling.

### Requirements

Introductory course to Operations Research.  

### Degree competences to which the subject contributes

**Specific:**

3. CE-2. Ability to master the proper terminology in a field that is necessary to apply statistical or operations research models and methods to solve real problems.
4. CE-3. Ability to formulate, analyze and validate models applicable to practical problems. Ability to select the method and / or statistical or operations research technique more appropriate to apply this model to the situation or problem.
5. CE-5. Ability to formulate and solve real problems of decision-making in different application areas being able to choose the statistical method and the optimization algorithm more suitable in every occasion.

**Transversal:**

1. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.
2. EFFECTIVE USE OF INFORMATION RESOURCES: Managing the acquisition, structuring, analysis and display of data and information in the chosen area of specialisation and critically assessing the results obtained.
The goal of this course is to introduce the student to the problems of system modeling in the presence of uncertainty, and familiarization with techniques and algorithms for dealing with them. The course deals with the case of stochastic programming, i.e. the optimization of problems with random variables. Stochastic modelling and programming bases are provided and it is hoped that upon completion of the course the student will be able to identify, model, formulate and solve decision-making problems with both deterministic and as random variables.

Abilities to Be Acquired:
* Identifying when a problem is suitable to be modeled and solved as a stochastic optimization problem.
* Formulation of stochastic optimization problems, determining decisions in the first, second and next stages.
* Knowledge of the basic properties of stochastic optimization problems.
* Knowledge of specialized solution methods for stochastic problems.
* Knowledge and use of software for the solution of stochastic problems.

Learning objectives of the subject

Theory:
The contents of the course will be presented and discussed by combining explanations on the board and with transparencies.

Problems:
Problems will be interspersed with the theory along with case studies, which will be presented and solved.

Lab sessions:
Laboratory sessions in which the use of software will be demonstrated for solving stochastic programming problems.

Language:
The course can be imparted in either English, Catalan or Spanish.
