200618 - OGD - Large Scale Optimization

Coordinating unit: 200 - FME - School of Mathematics and Statistics
Teaching unit: 715 - EIO - Department of Statistics and Operations Research
Academic year: 2018
Degree: MASTER'S DEGREE IN STATISTICS AND OPERATIONS RESEARCH (Syllabus 2013). (Teaching unit Optional)
ECTS credits: 5

Teaching staff
Coordinator: ESTEVE CODINA SANCHO
Others: Segon quadriemestre:
JORDI CASTRO PÉREZ - A
ESTEVE CODINA SANCHO - A

Prior skills
Basic knowledge of Operations Research / Optimization / Modelling in Mathematical Programming / Basic Linear Algebra.

Degree competences to which the subject contributes

Specific:
3. CE-2. Ability to master the proper terminology in a field that is necessary to apply statistical or operations research models and methods to solve real problems.
4. CE-3. Ability to formulate, analyze and validate models applicable to practical problems. Ability to select the method and / or statistical or operations research technique more appropriate to apply this model to the situation or problem.
5. CE-5. Ability to formulate and solve real problems of decision-making in different application areas being able to choose the statistical method and the optimization algorithm more suitable in every occasion.

Transversal:
1. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.
2. EFFECTIVE USE OF INFORMATION RESOURCES: Managing the acquisition, structuring, analysis and display of data and information in the chosen area of specialisation and critically assessing the results obtained.
The objective of this course is to introduce students to the solution of large-scale problems as well as the different existing methodologies, specially decomposition methods for structured problems and interior-point methods. On completion of the course, students should be familiar with different types of structured problems and should be able to identify the most appropriate methodology for each problem, in addition to obtaining the solution to the optimization problem in an efficient way.

Skills to be learned
* Given an optimization model, identify whether or not it is suitable to use a decomposition technique.
* Learn the main role played by Lagrangian duality and its relation with different decomposition techniques.
* Implement decomposition methods using algebraic languages for mathematical programming in different models with the aim of resolving them.
* Learn the differences between the simplex method for Linear Programming and the interior-point methods, as well as when it is suitable to use the former or the latter.
* Learn the foundations of the interior point methods, for LP, QP and convex NLP.
* Implement simple versions of interior-point methods with high-level languages (matlab), as well as learning the required linear algebra tools.

### Qualification system

Two practical assignments for each part of the course (1. Duality and decomposition; 2. interior-point methods). Each assignment is a 50% of the overall mark.
