

220341 - Internal Aerodynamics and Aeroelasticity of Turbomachines

Coordinating unit:	205 - ESEIAAT - Terrassa School of Industrial, Aerospace and Audiovisual Engineering		
Teaching unit:	220 - ETSEIAT - Terrassa School of Industrial and Aeronautical Engineering		
Academic year:	2018		
Degree:	MASTER'S DEGREE IN AERONAUTICAL ENGINEERING (Syllabus 2014). (Teaching unit Optional) MASTER'S DEGREE IN SPACE AND AERONAUTICAL ENGINEERING (Syllabus 2016). (Teaching unit Optional)		
ECTS credits:	5	Teaching languages:	English

Teaching staff

Coordinator:	Carlos-David Perez-Segarra
Others:	Aleix Báez Vidal Jordi Muela Castro Ignacio González

Opening hours

Timetable:	Set upon request
------------	------------------

Prior skills

Knowledge of solid dynamics, fluid dynamics and heat and mass transfer, as well as a programming language, acquired in the respective subjects.

Requirements

Knowledge equivalent to completion of the leveling course of the master

Teaching methodology

During the development of the course will use the following teaching methods:

Lecture or conference (EXP): presentation from teachers through lectures or by outsiders through invited lectures.
Participatory classes (parts): collective decision exercises, discussions and group dynamics with the teacher and other students in the classroom; Classroom presentation of an activity carried out individually or in small groups.
Presentations (PS): present in the classroom an activity conducted individually or in small groups (in person).
Theoretical and practical work directed (TD): completion of a classroom activity or theoretical/practical exercise, individually or in small groups with the teacher's guidance.
Project activity or reduced work scope (PR): Based Learning conducting individual or group of work of limited complexity or length, applying knowledge and presenting results.
Project or work of broader scope (PA): learning based on the design, planning and implementation of a group wide project or job complexity or length, applying and extending knowledge and writing a report poured approach this and the results and conclusions.
Activities Evaluation (EV).

Learning objectives of the subject

The course aims at describing the fundamental laws governing flows within turbomachinery, together with basic and advanced techniques to study them. In the course several important topics related to rotating turbomachinery are described: turbulence, compressible description of flows, boundary layer analysis, rotating flows, etc. Transient effects

220341 - Internal Aerodynamics and Aeroelasticity of Turbomachines

usually encountered are also detailed, such as stall and surge. The interaction between fluid flow and turbomachinery structure, aeroelastic effects, are studied and described in detail.

A two level analysis of the phenomena of interest will be presented at the course. Analysis of the general equations under restrictive assumptions is made to evidence the general behaviour of the flow, which also serves to perform initial estimations and analysis. The second level of analysis uses advanced modelling approaches, such as Computational Fluid Dynamics (CFD) techniques and Computational Structural Dynamics (CSD).

The reduced analysis level serves the student to understand the underlying physical effects in the studied case. With this background advanced techniques are presented for the student to apply this knowledge using state of the art techniques. Due to the effort required to solve the physical equations, computational techniques are usually needed. Hence, in the course extensive description of CFD and CSD techniques are presented. Specifically, several methods specific for rotating elements are covered, such as methods for moving meshes or dynamic meshes. Similarly, specific techniques for the structural analysis are described.

Due to the focus on computational methods, students are expected to use and develop computational codes. Specific lectures during the course cover different aspects of computational methods.

Objectives of learning process:

- Understand the physical phenomena that govern the flow within turbomachinery.
- Acquiring knowledge on basic aeroelasticity physics and unsteady modelling of turbomachinery.
- Acquiring a first practical experience in turbomachinery blade design, programming an own C++ code for preliminary aerodynamic design of turbomachines.
- Become familiar with advanced CFD methods applied to turbomachinery by means of open source or own developed CFD packages.
- Become familiar with advanced unsteady coupled CFD and CSD methods applied to turbomachinery by means of open source or own developed CFD packages.

Study load

Total learning time: 125h	Hours large group:	30h	24.00%
	Hours small group:	15h	12.00%
	Self study:	80h	64.00%

220341 - Internal Aerodynamics and Aeroelasticity of Turbomachines

Content

Introduction to unsteady rotating blade physics and fluttering.

Learning time: 10h

Theory classes: 4h

Self study : 6h

Description:

Review of the different key components of a turbomachinery will be carried out. Different types of turbomachinery will be covered and discussed. In addition, steady and unsteady physics at the airfoil, cascade and rotating blade level will be covered.

Related activities:

Individual meetings with the students in order to choose and define the practical work to be carried out.

Internal aerodynamic methods for turbomachinery.

Learning time: 62h

Theory classes: 14h

Laboratory classes: 8h

Self study : 40h

Description:

Two dimensional and three-dimensional methods for the design of different types of turbomachines will be reviewed in detail. The design methods will cover axial-flow turbines, axial-flow compressors, fans and radial flow gas turbines. Methods to be covered:

- Reduced models for blade design
 - Work and energy conservation
 - Stage characterisation: degree of reaction, work coefficient, flow coefficient.
 - Stage flow pattern: velocity triangles
 - Stage losses
 - Bi- and tri-dimensional effects.
- Pseudo 2D CFD methods for the simulation of turbomachinery profiles:
 - Numerical methods for incompressible and compressible CFD
 - Turbulence modelling adaptation (RANS, RANS/LES and LES)
 - Boundary conditions
 - Best-user guides for meshing
 - Post-processing methodologies
- Stator-rotor interaction using dynamic meshes methods
 - Arbitrary Lagrangian Eulerian (ALE) formulation for incompressible and compressible NS equations
 - Reference frame methods vs dynamic mesh methods for the simulation of turbomachines rotors.
 - Sliding mesh methods for cascade and 3D stator-rotor simulations
- Multi-scale methods for the simulation of complex systems (Blade Element Method integration with 3D NS solvers)

Related activities:

- A C++ design code for a specific turbomachinery application is expected to be developed by the student within this module.
- 2D airfoil simulations in a periodic arrangement by means of RANS techniques will be carried out using existing CFD packages or student developed CFD tools.
- Stator-rotor interaction by means of 2D RANS solvers and sliding mesh techniques. The activity will be done using existing CFD packages or student developed CFD tools.

220341 - Internal Aerodynamics and Aeroelasticity of Turbomachines

<p>Aeroelasticity methods for turbomachinery.</p>	<p>Learning time: 53h Theory classes: 12h Laboratory classes: 7h Self study : 34h</p>
<p>Description:</p> <p>A methodology for the coupled simulation of the fluid-structure turbomachinery problems with high-fidelity models will be given. First, basic CFD methodologies using the ALE formulation, including turbulence modelling will be covered. After, dynamic mesh methods will be reviewed and tested using open CFD packages or student developed CFD codes. Finally, CFD coupling algorithms and simplified CSD models will be covered. In detail, the following topics will be covered:</p> <ul style="list-style-type: none"> - Space Conservation Law for moving boundaries CFD problems. - Moving mesh methods: <ul style="list-style-type: none"> - Radial basis interpolation methods. - Spring analogy algorithms. - Approximate CSD solvers approach. - Modal methods for the CSD modelling of turbine blades - Coupling algorithms for Fluid Structure methods: <ul style="list-style-type: none"> - Monotonic approaches. - Semi-implicit coupling. - Loosely coupled algorithms. <p>Related activities:</p> <ul style="list-style-type: none"> - The students will apply the different studied techniques, simulating a simplified aeroelasticity problem using an existing CFD package or an own developed CFD package. 	

Qualification system

Written test: 30%

Works done individually and/or in groups throughout the course in internal aerodynamics: 40%

Works done individually and/or in groups throughout the course in aeroelasticity: 15%

For those students who meet the requirements and submit to the reevaluation examination, the grade of the reevaluation exam will replace the grades of all the on-site written evaluation acts (tests, midterm and final exams) and the grades obtained during the course for lab practices, works, projects and presentations will be kept.

If the final grade after reevaluation is lower than 5.0, it will replace the initial one only if it is higher. If the final grade after reevaluation is greater or equal to 5.0, the final grade of the subject will be pass 5.0

220341 - Internal Aerodynamics and Aeroelasticity of Turbomachines

Regulations for carrying out activities

Students must follow the instructions explained in class and contained in the file with the activities to develop in practice. As a result of these activities, the student must submit a report (preferably in pdf format) to the teacher, following his instructions and deadline for each activity. The assessment will involve both its accomplishment, as well as their defense.

Practices:

Practical exercises can begin during the class schedule planned for this activity and will be completed (if necessary) as autonomous activity, following the instructions given in class. The results of practical exercises will be given to the teacher by following the instructions given in class. The evaluation of the practice can lead to both its implementation, as well as their defense.

Exams:

There will be a final exam for the course. Students must complete both theoretical questions and problems related to theoretical and practical content of the course.

Reviews and / or claims with reference to the exams are conducted according to the dates and times established in the academic calendar.
