## Teaching staff

- **Coordinator:** JOSÉ MARÍA SALLÁN LEYES
- **Others:** JOSÉ MARÍA SALLÁN LEYES

## Degree competences to which the subject contributes

### Specific:

1. Apply concepts and techniques of descriptive and statistical inference under uncertainty.
3. Apply theories and inherent principles in the production and logistics area in order to analyze uncertainty complex situations and make decisions using engineering tools.
4. Apply theories and inherent principles in the personal area in order to analyze uncertainty complex situations and make decisions using engineering tools.
5. Apply theories and inherent principles in the general direction of an organization with the aim of analyzing uncertainty complex situations and make decisions using engineering tools.
6. Develop and present a research proposal according to the criteria of the international scientific community.

### Generical:

7. Ability to integrate knowledge and formulate judgments with the aim of making decisions based on information that, with incomplete or limited include reflecting on social and ethical responsibilities linked to the application of their knowledge and judgments.
8. Ability to effectively communicate their findings, knowledge and concluding reasons to skilled and unskilled audiences, clearly and unambiguously.
9. Self-learning capacity to independent continuous training.
The course Research Seminars on Management Engineering introduces students to the concepts, principles and fundamentals of scientific research in Management Engineering organization from two points of view: the first presents the research from a methodological point of view (and more theoretical and formal) and a second point of view where cases and particular areas of scientific research in the engineering organization are presented.

Learning objectives of the subject

The course Research Seminars on Management Engineering introduces students to the concepts, principles and fundamentals of scientific research in Management Engineering organization from two points of view: the first presents the research from a methodological point of view (and more theoretical and formal) and a second point of view where cases and particular areas of scientific research in the engineering organization are presented.

Teaching methodology

The course is divided into three parts:

Theory classes
Guided activities class
Self-study for doing exercises and activities.

In the theory classes, teachers will introduce the theoretical basis of the concepts, methods and results and illustrate them with examples appropriate to facilitate their understanding.

In the guided activity class (in the classroom), teachers guide students in applying theoretical concepts to solve problems, always using critical reasoning. We propose that students solve exercises in and outside the classroom, to promote contact and use the basic tools needed to solve problems.

Students, independently, need to work on the materials provided by teachers and the outcomes of the sessions of exercises/problems, in order to fix and assimilate the concepts.

The teachers provide the curriculum and monitoring of activities (by ATENEA).
The grade is obtained through three assignments, with a joint weight of 50%, a research proposal weighting 25% and an exam with a weight of 25%. The exam will be taken the last day of class. Students with nonsatisfactory results on the exam can enhance their grade by doing another exam on the date where the final exam is scheduled. Final grade will be calculated with the best score on the two exams the students have taken. All students can take the second exam.

**Qualification system**

The research question
Quality indexes for scientific research
Working with the literature
Research design
Data collection
Data management and analysis
The challenge of writing the results

**Bibliography**
