Course guides
230601 - SIGPRO - Signal Processing

Unit in charge: Barcelona School of Telecommunications Engineering
Teaching unit: 739 - TSC - Department of Signal Theory and Communications.
Degree: MASTER'S DEGREE IN TELECOMMUNICATIONS ENGINEERING (Syllabus 2013). (Optional subject).
Academic year: 2020 ECTS Credits: 5.0 Languages: English

LECTURER
Coordinating lecturer: Climent Nadeu
Others: Meritxell Lamarca

PRIOR SKILLS
Advanced knowledge of Signals, Systems, and Transforms
Basic knowledge of Probability, Random Variables and Stochastic processes

REQUIREMENTS
Two courses of the area Signals, Systems, and Transforms
At least one course about Probability, Random Variables and Stochastic Processes

DEGREE COMPETENCES TO WHICH THE SUBJECT CONTRIBUTES
Specific:
1. Ability to process continuous variable signals using digital techniques.
2. Ability to characterize deterministic and random signals in time or space, and in the frequency domain.
3. Ability to analyze, model, identify and simulate linear systems, especially digital filters and adaptive systems.
4. Ability to apply information theory methods, adaptive modulation and channel coding, as well as advanced techniques of digital signal processing to communication and audiovisual systems.

Transversal:
5. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.
7. FOREIGN LANGUAGE: Achieving a level of spoken and written proficiency in a foreign language, preferably English, that meets the needs of the profession and the labour market.

TEACHING METHODOLOGY
- Lectures
- Exercises and applications
- Laboratory work (three 2-hour sessions)
- Individual work and team work
- Assignments
- Short and extended answer tests (Partial and Final Exams)
LEARNING OBJECTIVES OF THE SUBJECT

Learning objectives of the subject:

Understanding the concepts and techniques of the field of statistical signal processing, and their application to problems arising from real applications.

Learning results of the subject:

Given several application contexts from multimedia and communications, the students develop their ability to digitally process, with linear systems and transforms, signals from those applications which are modelled as stochastic processes.

Total learning time: 125 h

CONTENTS

1. Fundamentals of signal processing

Description:
- Introduction and applications
- Discrete-time signal processing
- Random variables and sequences

Full-or-part-time: 34h
Theory classes: 9h
Self study: 25h

2. Basic estimation theory

Description:
- Principles of estimation theory
- ML and MAP estimation

Full-or-part-time: 14h
Theory classes: 3h
Laboratory classes: 2h
Self study: 9h

3. Nonparametric spectrum estimation

Description:
- Periodogram and autocorrelation estimates
- Smoothing the periodogram. Applications

Full-or-part-time: 27h
Theory classes: 7h
Laboratory classes: 2h
Self study: 18h
4. Signal modeling and parametric spectral estimation

**Description:**
- Linear models of random processes
- AR-based spectral estimation. Applications

**Full-or-part-time:** 20h
Theory classes: 4h  
Laboratory classes: 2h  
Self study: 14h

5. Wiener filtering

**Description:**
- Optimal linear filters and predictors
- Adaptive filters. LMS algorithm.
- Applications

**Full-or-part-time:** 30h
Theory classes: 8h  
Laboratory classes: 2h  
Self study: 20h

**GRADING SYSTEM**

Final exam: 40%  
Partial exams: 30%  
Laboratory work: 20%  
Assignments: 10%

**BIBLIOGRAPHY**

**Basic:**

**Complementary:**

**RESOURCES**

**Other resources:**
Teacher's material: notes, problem sets, laboratory guides
