Degree competences to which the subject contributes

Specific:
1. Ability to understand and apply the principles of operation of power electronic systems in regulation, undulation and amplification applications.
2. Ability to understand and apply the principles of operation of the current control method and its application to battery charging, supply for LED lighting, power factor correction, and "Low Power supplies".
3. Ability to apply state control techniques to the design of controllers for power electronic systems.
4. Ability to design continuous and discrete time controllers for power electronic systems.

Transversal:
5. EFFECTIVE USE OF INFORMATION RESOURCES: Managing the acquisition, structuring, analysis and display of data and information in the chosen area of specialisation and critically assessing the results obtained.
6. FOREIGN LANGUAGE: Achieving a level of spoken and written proficiency in a foreign language, preferably English, that meets the needs of the profession and the labour market.

Teaching methodology
- Lectures
- Exercises
- Other activities

Learning objectives of the subject

The aim of this course is to introduce the students in several techniques of modelling, design and control of power processing systems for regulation, wide-band amplification and waveform generation in different applications.

Requisites: Students coming from academic studies other than B. Sc. Electronics Systems Engineering or equivalent ones,
230641 - PCP - Power Control and Processing

should have successfully passed the examinations of the bridging courses "Control" and "POT".

Learning results of the subject:

- Ability to derive state models of switching power converter circuits.
- Ability to design and verify the features, by numerical simulation, of state linear controllers for switching power converters in amplification, regulation and waveform generation applications.
- Ability to identify the design restrictions involved in the digital implementation of continuous time controllers for switching power converters.

### Content

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
<th>Learning time</th>
<th>Theory classes</th>
<th>Self study</th>
</tr>
</thead>
</table>
| **1. Introduction to power processing systems** | **Description:**  
- Circuit elements in high-efficiency power processors  
- Power conversion types  
- Switching power converters  
- Functionalities and control requirements: regulation, amplification and waveform generation. | **Learning time:** 10h  
Theory classes: 3h  
Self study: 7h | | |
| **2. Switching converters modelling** | **Description:**  
- State space description of dynamical systems  
- Dynamical systems classification (linear and nonlinear systems, time-varying and time-invariant systems, SISO and MIMO systems)  
- State-space models of switching power converters: nonlinear and linearized models.  
  - Steady-state behaviour. Equilibrium points.  
  - Linearized dynamical behaviour: transfer functions | **Learning time:** 25h  
Theory classes: 7h  
Self study: 18h | | |
| **3. State-space linear control techniques in switching power converters** | **Description:**  
- Eigenvalues. Stability analysis.  
- Output feedback.  
- State feedback. Pole placement design through Ackermann's formula  
- Discrete-time control: analysis and constraints. Implementation issues | **Learning time:** 44h  
Theory classes: 14h  
Self study: 30h | | |
4. Control applications in power electronics
