250432 - ENGGESCOST - Coastal Engineering and Management

Coordinating unit: 250 - ETSECCPB - Barcelona School of Civil Engineering
Teaching unit: 751 - DECA - Department of Civil and Environmental Engineering
Academic year: 2019
Degree: MASTER'S DEGREE IN CIVIL ENGINEERING (PROFESSIONAL TRACK) (Syllabus 2012). (Teaching unit Optional)
MASTER'S DEGREE IN CIVIL ENGINEERING (PROFESSIONAL TRACK) (Syllabus 2012). (Teaching unit Optional)
ECTS credits: 5
Teaching languages: Catalan, Spanish, English

Teaching staff
Coordinator: JOSE ANTONIO JIMENEZ QUINTANA
Others: MANEL ESPINO INFANTES, JOSE ANTONIO JIMENEZ QUINTANA

Opening hours
Timetable: Wednesday 14:00 to 15:00

Degree competences to which the subject contributes

Specific:
8233. Knowledge of and the ability to understand dynamic phenomena of the coastal ocean and atmosphere and respond to problems encountered in port and coastal areas, including the environmental impact of coastal interventions. The ability to analyse and plan maritime works.

Transversal:
8559. ENTREPRENEURSHIP AND INNOVATION: Being aware of and understanding the mechanisms on which scientific research is based, as well as the mechanisms and instruments for transferring results among socio-economic agents involved in research, development and innovation processes.
8560. SUSTAINABILITY AND SOCIAL COMMITMENT: Being aware of and understanding the complexity of the economic and social phenomena typical of a welfare society, and being able to relate social welfare to globalisation and sustainability and to use technique, technology, economics and sustainability in a balanced and compatible manner.
8561. TEAMWORK: Being able to work in an interdisciplinary team, whether as a member or as a leader, with the aim of contributing to projects pragmatically and responsibly and making commitments in view of the resources that are available.

Teaching methodology

The course consists of 3 hours per week of classroom activity

2.2 hours are devoted to theoretical lectures, in which the teacher presents the basic concepts and topics of the subject, shows examples and solves exercises.

0.8 hours is devoted to solving practical problems with greater interaction with the students. The objective of these practical exercises is to consolidate the general and specific learning objectives.

Support material in the form of a detailed teaching plan is provided using the virtual campus ATENEA: content, program of learning and assessment activities conducted and literature.
250432 - ENGGESCOST - Coastal Engineering and Management

Learning objectives of the subject

Specialization subject in which knowledge on specific competences is intensified.

Knowledge and skills at specialization level that permit the development and application of techniques and methodologies at advanced level.

Contents of specialization at master level related to research or innovation in the field of engineering.

The objective of this course is to train students in the fields of dynamics, water quality and sediment transport in coastal areas, as well as in engineering and management activities in that area.

In particular, it is intended that students acquire an advanced knowledge of the agents and processes that act in the coastal zone (coastal dynamics, water quality and sediment transport). This training will focus mainly on training the student in the quantification of the processes which present the main methods, models and estimation techniques, emphasizing the range of application and validity.

Study load

| Total learning time: 125h | Hours large group: | 19h 30m | 15.60% |
| | Hours medium group: | 9h 45m | 7.80% |
| | Hours small group: | 9h 45m | 7.80% |
| | Guided activities: | 6h | 4.80% |
| | Self study: | 80h | 64.00% |
# Content

## Introduction

### Description:
Presentation and course structure.
The coastal area. Delimitation and components.
Applications, resources, ecosystem functions and services. Processes, responses, pressures, impacts and issues in the coastal zone

### Specific objectives:
Approach of the course objectives and course development. Concepts of time and space scales to define processes, problems and solutions.
Basic types of coastal problems.
Sustainability.

### Learning time:

</tbody>
</table>

## Hydrodynamic Modeling in Coastal Environments

### Description:
Basics waves. Spectral wave models. Waves in coastal areas. Introduction to SWAN model
Practical exercises with computer about the SWAN model
Types of currents at sea. Observation and representation of oceanographic variables. Modeling ocean currents.
Examples of Operational Oceanography.

### Specific objectives:
To familiarize students with the mathematical description of waves costaneras relevant from the perspective of civil engineering
To familiarize students with the model of wave generation and propagation SWAN
To familiarize students with the mathematical description and numerical ocean currents relevant from the perspective of civil engineering.

## Dispersion of pollutants in coastal areas and estuaries

### Description:
- Molecular and turbulent diffusion.
- Dispersion in coastal and estuarine areas.
- Numerical models and field measurements.

- Statistics spills.
- Physical and chemical characteristics of oil.
- Environmental conditions.
- Processes and algorithms.
- Spills submarines.
- Dispersants.
- Models and applications.

Work experience with GNOME and ADIOS models from NOAA.

### Specific objectives:
- Study of the physical and mathematical models related to the dispersion and transport of pollutants in the coastal zone.
- To familiarize the student with the problematic of oil spills at sea and the subsequent arrival of fuel stains on the coast, driven by currents, waves and wind.
- To familiarize students with oil spill models GNOME and ADIOS from NOAA.

## Evaluation

### Learning time: 12h
- Laboratory classes: 5h
- Self study: 7h

Qualification system

The mark of the course is obtained from the qualifications of the tutored course work (30%) and two specific evaluation tests (35% each one).

Course work is directed to develop a maritime engineering analysis to a real problem of the Spanish coast. Requires teamwork, preparation of a written report and a final presentation in front of the class.

Specific evaluation tests consist of a part with questions on concepts associated with the learning objectives of the course in terms of knowledge or understanding, and a set of application exercises.

Regulations for carrying out activities

Marks will range between 10 (maximum score) to 0 (minimum score)

The specific evaluation test will give approximate equal weight to the conceptual questions and to the application exercises. The tutored course work will be evaluated from the written report and the oral presentation. Different marks may be given to different members of the team, based on their respective contributions to the team work.
