Course guide
250665 - CONTACUST - Noise Pollution

Unit in charge: Barcelona School of Civil Engineering
Teaching unit: 739 - TSC - Department of Signal Theory and Communications.
Degree: MASTER'S DEGREE IN ENVIRONMENTAL ENGINEERING (Syllabus 2014). (Optional subject).
Academic year: 2020 ECTS Credits: 5.0 Languages: Catalan, Spanish, English

LECTURER

Coordinating lecturer: JORDI ROMEU GARBI
Others: JORDI ROMEU GARBI

DEGREE COMPETENCES TO WHICH THE SUBJECT CONTRIBUTES

Specific:
13340. Apply scientific concepts to environmental problems and their correlation with technological concepts.
13347. Dimension unconventional systems and advanced treatment and raise their mass balance and energy.

TEACHING METHODOLOGY

The methodology is based on the combination of several activities

- Classroom lectures on theoretical concepts that are related to the course. Related problems are also solved.
- A set of individual problems are proposed as a homework.
- Experimental noise impact assessment activity is individually carried out also as a homework.
- Calculation of acoustic impact of infrastructure by simulation. Work group within the classroom sessions and as homework.

LEARNING OBJECTIVES OF THE SUBJECT

CE01 - Apply scientific concepts to environmental problems and their correlation with technological concepts.
CE08-Dimension unconventional systems and advanced treatment and raise their mass balance and energy.

Explore scientific concepts and technical principles of quality management of the receiving means, atmosphere, water and soil, and applied to problem solving.
Explore scientific concepts and technical principles of management and treatment of gaseous emissions, water supply, sewage and waste and remediation techniques for groundwater and contaminated soils.
Sized systems for the treatment of major pollutants vectors in specific sectors of activity.
Interprets rules, identifies goals, assesses technical alternatives proposed unconventional solutions and priority actions.

Definition of the characteristic parameters of sound and its perception.
Sound propagation in free field. Sound power. Corrections to the theoretical propagation.
Reflection and sound absorbing materials. Acoustic behavior of a room.
Sound measurements. Using sound level meter and analyzer. Good practice in sampling.
Noise impact study. Input data, assumptions and deliverables. Calculation methods and simulation models. Study applied the existing legal framework.

The goal of the course is that the student is able to make the study of acoustic assessment of existing or future activity.

Total learning time: 125 h

CONTENTS

Noise measurement

Description:
Presentation of theoretical concepts relating to the measurement of noise
Solving problems related to noise measurement

Specific objectives:
Understand the theoretical principles governing noise measurement
Application of theoretical concepts of measurement noise, Strengthen the theory governing the measurement of noise.

Full-or-part-time: 14h 23m
Theory classes: 3h
Practical classes: 2h
Laboratory classes: 1h
Self study : 8h 23m

Environmental noise assessment

Description:
Establish the criteria and procedure for the assessment of environmental noise
Case study of theoretical evaluation of environmental noise
Oral presentation of the experimental noise assessment

Specific objectives:
Have the basic tools to proceed with an assessment of environmental noise
Understand how to assess environmental noise
Learn how to write a report and how to present an environmental impact assessment case

Full-or-part-time: 31h 12m
Theory classes: 4h
Practical classes: 4h
Laboratory classes: 5h
Self study : 18h 12m
Sound propagation

Description:
Theory about the effects that affect sound propagation
Problems related to the phenomena of sound propagation
Computational acoustic impact of a great activity in your environment

Specific objectives:
Understand the phenomena that affect sound propagation
Properly characterize and predict the propagation of sound and reduce it as a matter of noise control strategy.
Learn to make noise impact studies of great sources in its environment

Full-or-part-time: 38h 24m
Theory classes: 5h
Practical classes: 4h
Laboratory classes: 7h
Self study: 22h 24m

GRADING SYSTEM

Home work individual activities: 35%
Experimental work on acoustic impact assessment of an activity: 35%
Computer practice on acoustic impact assessment: 30%

EXAMINATION RULES.

Results not delivered within the deadline will result in zero points for the activity.
