In this course the physics behind the most important medical imaging modalities will be treated. After an introductory lecture, microscopic imaging (optical, electronic, atomic force), radiology (X-ray, computer tomography), nuclear imaging (SPECT and PET) and magnetic resonance imaging (NMR) will be discussed. The increasing importance of medical imaging for diagnosis and guiding surgery will be emphasized.

Degree competences to which the content contributes:

(ENG) Biomedical image reconstruction
Degree competences to which the content contributes:

(ENG) Examples of Image Processing in Nuclear Medicine
Degree competences to which the content contributes:

Qualification system

The evaluation criteria will be twofold. Firstly, we will consider activities developed by the students along the course (as algorithm developing, further study of some question, etc.). These activities will be evaluated through a written report or an oral presentation. Secondly, through some kind of final examination to insure that the alumni have a general understanding of the issues taught in the course.
