The aim of the course is to bring students to the fundamentals of energy economics and the close relationship between economics and sustainable energy systems, providing them the basic tools needed to understand the current energy problems and their interconnection with other fields. In essence it is intended:
- To know the basic terminology and classifications related to energy products
- To understand the accounting of energy flows from the original supply sources (through conversion processes) to end-use demands
- To get familiar with the main energy data sources available at international level
- To be able to analyse the supply and demand situation of a country from its energy balance
- To understand and analyse energy demand from various perspectives and methodologies.
- To know the basis of the European renewable energy policy and the mechanisms so far applied to promote it and the lessons learned
- To know and understand the fundamentals behind the investment decision on a renewable energy asset
- To be familiar with the basis of the energy systems planning

Learning objectives of the subject

Master class, guided study sections, continuous evaluation activities and final project.

480073 - Energy Economics and Sustainable Energy Systems

## Content

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>Learning time:</th>
<th>Theory classes:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. INTRODUCTION.</strong></td>
<td>1.1. Basic definitions: primary and secondary, renewable and non-renewable, commercial and non-commercial, conventional and non-conventional energy products. 1.2. Energy supply chain components. 1.3. Flow of energy products.</td>
<td>1h 30m</td>
<td>1h 30m</td>
</tr>
<tr>
<td><strong>2. ENERGY BALANCE</strong></td>
<td>2.1. Definition of energy balance, structure and typologies. 2.2. Analysis of the information of the energy balance. Energy supply mix, self-reliance in supply, share of renewable energies, efficiency of electricity generation, power generation mix, refining efficiency, overall energy transformation efficiency, per capita consumption of primary and final energy, energy intensity.</td>
<td>3h</td>
<td>3h</td>
</tr>
<tr>
<td><strong>3. ECONOMIC FOUNDATIONS OF ENERGY DEMAND</strong></td>
<td>3.1. Microeconomics basic concepts. 3.2. Analysis of the consumer’s demand for energy: Utility maximization problem. Consumer’s preferences, utility function, budget line, indifference curves. The method of Lagrange multipliers. Energy demand curve of an individual, energy demand curve of the market. 3.3. Cost minimization problem of the producer. Production function, isoquant curves, total cost of production, isocost lines, conditional factor demand functions, production expansion path.</td>
<td>3h</td>
<td>3h</td>
</tr>
<tr>
<td><strong>4. ALTERNATIVE APPROACHES TO ENERGY DEMAND ANALYSIS.</strong></td>
<td>4.1. Descriptive analysis. Growth rates: year-on-year growth rate and annual average growth rate over a period. Demand elasticities. Energy intensities. 4.2. Decomposition analysis. Analysis of change in total energy demand. Analysis of changes in energy intensities.</td>
<td>3h</td>
<td>3h</td>

### 5. EUROPEAN RENEWABLE ENERGY POLICY

**Description:**
- 5.1. Energy balance and renewable energy policy
- 5.2. Legal framework and policy targets
- 5.3. Support mechanisms to promote renewable energy systems
- 5.4. Lessons learned from the European experience and prospective

**Learning time:** 1h 30m  
**Theory classes:** 1h 30m

### 6. ECONOMICS OF RENEWABLE ENERGY ASSETS FROM INVESTORS? PERSPECTIVE

**Description:**
- 6.1. Fundamentals for the economic evaluation of the renewable energy asset
- 6.2. Economic indexes and selection criteria
- 6.3. Investment decision, uncertainty and risk
- 6.4. Regulatory retroactivity and investment risk
- 6.5. A simplified methodology applied to identify the regulatory risk

**Learning time:** 3h  
**Theory classes:** 3h

### 7. ENERGY SYSTEM PLANNING AND ECONOMICS FROM THE GOVERNMENT PERSPECTIVE

**Description:**
- 7.1. The need of a framework for an integrated analysis
- 7.2. Energy systems models and evolution
- 7.3. Introduction to sustainable energy planning

**Learning time:** 3h  
**Theory classes:** 3h
8. Guided activities

**Description:**
- Preparation of an energy balance from data of energy products flows.
- Analysis of the energy balance of a country.
- Data collection and analysis of the primary energy demand and energy intensity at world and regional levels in a determined period, identifying the most significant trends and performing international comparisons.
- Application of different decomposition analysis methodologies to primary energy demand and energy intensity data at world and regional levels in a determined period, identifying the most significant trends and performing international comparisons.
- Analysis of the regulatory risk associated to the support mechanisms devoted to promote the renewable energy systems.
- Determination of a simplified economic model for determining the suitability of an investment in a renewable energy asset.
- The use of commercial software in order to be aware of the concepts and necessary requirements when planning a sustainable energy system.
- Final project

**Learning time:** 27h

Guided activities: 27h

Qualification system

Continuous evaluation of the work and activities carried out

Bibliography
