820747 - IERXE - Integration of Renewables in the Electric Grid

Coordinating unit: 240 - ETSEIB - Barcelona School of Industrial Engineering
Teaching unit: 709 - EE - Department of Electrical Engineering
Academic year: 2018
Degree: ERASMUS MUNDUS MASTER'S DEGREE IN ENVIRONOMICAL PATHWAYS FOR SUSTAINABLE ENERGY SYSTEMS (Syllabus 2010). (Teaching unit Compulsory)
ERASMUS MUNDUS MASTER'S DEGREE IN ENVIRONOMICAL PATHWAYS FOR SUSTAINABLE ENERGY SYSTEMS (Syllabus 2012). (Teaching unit Optional)
MASTER'S DEGREE IN ENERGY ENGINEERING (Syllabus 2013). (Teaching unit Optional)
ERASMUS MUNDUS MASTER'S DEGREE IN ENVIRONOMICAL PATHWAYS FOR SUSTAINABLE ENERGY SYSTEMS (Syllabus 2010). (Teaching unit Optional)
MASTER'S DEGREE IN ENERGY ENGINEERING (Syllabus 2013). (Teaching unit Optional)
ECTS credits: 5
Teaching languages: English

Teaching staff
Coordinator: Gomis Bellmunt, Oriol
Others: Gomis Bellmunt, Oriol

Prior skills
Basic electrical and mechanical engineering
Electrical circuits analysis

Requirements
Basic electrical and mechanical engineering
Electrical circuits analysis

Degree competences to which the subject contributes

Specific:
CEMT-1. Understand, describe and analyse, in a clear and comprehensive manner, the entire energy conversion chain, from its status as an energy source to its use as an energy service. They will also be able to identify, describe and analyse the situation and characteristics of the various energy resources and end uses of energy, in their economic, social and environmental dimensions, and to make value judgments.
CEMT-2. Identify and describe the components of electrical systems (production, transportation, distribution, markets, procurement and consumption) and evaluate the technological solutions used in the production of electricity.
CEMT-3. Assess the economic, social and environmental impact of the production, use and management of energy, with a holistic view of the life cycle of the different systems, and recognise and value the most remarkable developments in the fields of energy efficiency and the rational use of energy.
CEMT-4. Efficiently collect data on renewable energy resources and their statistical treatment and apply knowledge and endpoint criteria in the design and evaluation of technology solutions for using renewable energy resources, for both isolated systems and those connected to networks. They will also be able to recognise and evaluate the newest technological applications in the use of renewable energy resources.
CEMT-5. Employ technical and economic criteria to select the most appropriate thermal equipment for a given application, dimension thermal equipment and facilities, and recognise and evaluate the newest technological applications in the production, transportation, distribution, storage and use of thermal energy.
CEMT-6. Employ technical and economic criteria to select the most appropriate electrical equipment for a given application, dimension thermal equipment and facilities, and recognise and evaluate the newest technology.
The course will focus on providing the knowledge and the tools needed to understand and analyze the interaction between renewable energies and power systems.

Specific objectives include covering the following topics:
- Analysis of power systems with a high penetration of renewables
- Grid integration of renewables
- Smart grids
- Grid codes
- Isolated and connected Microgrids
- HVDC Supergrids for offshore wind
- The role of energy storage and demand side management

At the end of the course the students will be able to:
- Understand how power systems interact with renewable energy systems
- Analyze power systems with a high penetration of renewables
- Understand how renewable energies can be efficiently integrated in power systems
- Understand the smart grid concept and the relevance of renewable energies in it
- Analyze and design microgrids
- Analyze and design supergrids for offshore wind power

# Introduction

**Learning time:** 11h  
Laboratory classes: 1h  
Self study: 10h

**Description:**  
The module provides an introduction to the field of renewable energies to the electrical power system. The main technologies, trends and challenges will be introduced.

## Grid support

**Learning time:** 26h  
Laboratory classes: 6h  
Self study: 20h

**Description:**  
The module introduces grid support from renewable energies, including frequency support, voltage support and power system stability support. The different relevant grid codes are presented. Additional support technologies as energy storage or FACTs (flexible AC transmission systems) are described.

**Related activities:**  
Activity 1.

**Specific objectives:**  
Voltage support, Frequency support, Grid codes, Energy storage, FACTS.

## Supergrids

**Learning time:** 28h  
Laboratory classes: 8h  
Self study: 20h

**Description:**  
The Supergrid concept is presented. It allows integration of large amounts of renewable (as offshore wind), also interconnecting different power system. HVDC transmission systems are introduced and analyzed. Some relevant projects as Desertec, Medgrid, European Supergrid are presented.

**Related activities:**  
Activity 2.
The microgrid concept is presented. It allows integration of different renewable energy sources combined with energy storage devices in isolated or grid connected grids. Different microgrid example will be discussed and analyzed.

**Related activities:**
Activity 3
# Planning of activities
