

820731 - ESEC - Power System

Coordinating unit: 240 - ETSEIB - Barcelona School of Industrial Engineering
 Teaching unit: 721 - FEN - Department of Physics and Nuclear Engineering
 709 - EE - Department of Electrical Engineering
 Academic year: 2019
 Degree: MASTER'S DEGREE IN ENERGY ENGINEERING (Syllabus 2013). (Teaching unit Compulsory)
 MASTER'S DEGREE IN ENERGY ENGINEERING (Syllabus 2013). (Teaching unit Compulsory)
 ERASMUS MUNDUS MASTER'S DEGREE IN ENVIRONMENTAL PATHWAYS FOR SUSTAINABLE
 ENERGY SYSTEMS (Syllabus 2013). (Teaching unit Optional)
 ECTS credits: 5 Teaching languages: English

Teaching staff

Coordinator: Freixa Terradas, Jordi
 Others: Villafáfila Robles, Roberto
 Freixa Terradas, Jordi

Opening hours

Timetable: To arrange by e-mail

Degree competences to which the subject contributes

Specific:

CEMT-2. Identify and describe the components of electrical systems (production, transportation, distribution, markets, procurement and consumption) and evaluate the technological solutions used in the production of electricity.

Teaching methodology

Theoretical lectures
 Practical sessions
 Guided work

Learning objectives of the subject

To describe the different technologies related to the production of electric energy
 To have an insight into the more significant aspects of electricity transportation and distribution
 To apply the acquired knowledge to solve practical cases

Study load

Total learning time: 125h	Hours large group:	30h	24.00%
	Guided activities:	15h	12.00%
	Self study:	80h	64.00%

820731 - ESEC - Power System

Content

<p>Topic 1: Introduction</p>	<p>Learning time: 3h Theory classes: 2h Self study : 1h</p>
<p>Description: This first topic describes the main characteristics of the structure of the spanish power system, concerning both demand and production.</p> <p>Specific objectives: To give the students a general overview of the spanish power system.</p>	
<p>Topic 2: Electrical energy production</p>	<p>Learning time: 35h Theory classes: 14h Guided activities: 7h Self study : 14h</p>
<p>Description: Description of different technologies of electrical energy production: Coal-fired power plants, combined cycle power plants, nuclear power plants, hydroelectric power plants, wind parcs and solar facilities (FV and thermal-solar).</p> <p>For each one of these tecnologies the operating principle, equipment, environmental impact and other relevant aspects are presented.</p> <p>Related activities: Resolution of practical cases</p>	
<p>Topic 3: Transport and distribution</p>	<p>Learning time: 26h Theory classes: 10h Guided activities: 6h Self study : 10h</p>
<p>Description: Description of the main characteristics of transport and distribution infrastructures (transmission and distribution systems, transforming stations and conversion stations) Analysis of the technological aspects related to the grid regulation.</p> <p>Related activities: Calculation of power lines. Resolution of practical cases.</p> <p>Specific objectives: Students should know the difference between transport and distribution. They should be aware of the causes of electrical energy losses during its transport and distribution in order to reason about maximum lengths of the grid. Students should know the main characteristics of transport and distribution infrastructures.</p>
