Objective:
To identify mutagenic chemical agents, learn the routes into the body, and find out how to protect yourself when handling them.

Area of application: laboratories and workshops in which mutagenic chemical agents are handled.

What is a mutagenic chemical agent?
It is a substance or mixture of substances that can cause mutations (a permanent change in the amount or structure of the genetic material in a cell) in human stem cells that can be transmitted to descendants.

Classifications:

**Category 1A**
Substances that are known to be mutagens, based on the existence of human evidence.

**Category 1B**
Substances that are known to be mutagens for humans, based on the existence of animal evidence.

**Category 2**
Substances that are suspected of being mutagens for humans.
To identify mutagenic chemical agents, consult the label and/or the safety data sheet (SDS).

Consult point 2 on the identification of hazards in the corresponding safety data sheet (SDS), which provides the information required to identify a mutagenic chemical agent.

* Special risks attributed to hazardous substances and preparations, according to RD363/1995 and RD255/2003
RESPIRATORY ROUTE

The route into the body for any chemical agent that is in the air in the form of a gas, vapour, fumes, powder, fibre, etc. that is taken into the lungs when the individual breathes in – inhales the surrounding air through the nose or mouth. Depending on the volume and shape of the particles, they will reach different distances along their passage through the respiratory system.

DIGESTIVE ROUTE

The route for chemical agents, which involves their ingestion, generally due to an involuntary action that is almost always associated with unhygienic practices and habits.

DERMAL ROUTE

The route for chemical agents that, when they come into contact with the skin, can cross it and reach the blood. The blood then distributes the chemicals around the body. Contact with eyes (irritation, etc.) is part of this route.

PARENTERAL ROUTE

The route for chemical agents through injuries to the skin or direct inoculation with the toxin.
If the mutagenic agent is replaced by another chemical agent, the risk of exposure is eliminated.

Generally, chemical agents that are **mutagenic do not have a universal replacement**, but can be substituted in certain applications by other chemical agents that are not mutagenic, or by alternative processes.

**Example of a MUTAGENIC chemical agent**

**For more information on potential substitutes, consult the INFOCARQUIM (INFOrmació sobre CARcinògens QUÍMics) database on the INSHT website:** [http://infocarquim.insht.es:86/Forms/About.aspx](http://infocarquim.insht.es:86/Forms/About.aspx)
If the mutagenic chemical agent cannot be replaced, implement the following preventive measures:

- **Obtain the right information** (indications of danger, preventive measures, etc.) by reading the chemical agent’s safety data sheet.

- **Work with air-tight equipment** so that you are not exposed to a mutagenic chemical agent, by preventing small accidental leaks at critical points in the system (valves, joints, etc.).

- **Limit the amounts and concentrations** of mutagenic chemical agent to minimise exposure.

- **Limit the number of workers** who handle mutagenic chemical agents and reduce the exposure time.

- **Handle** mutagenic chemical agents **within a fume cabinet** to prevent inhalation of vapour.

- **Use at least the following personal protection equipment:**
  - Nitrile and/or neoprene chemical protection gloves.
  - Safety goggles (wraparound) to avoid contact with the chemical agent through the skin and eyes.

- **Store** mutagenic chemical agents in a specific cabinet for chemical storage, **with access restricted** to authorised personnel.

For further information on chemical agents, consult the Chemical Products section of the prevention website: [http://www.upc.edu/prevencio/ca/seguretat-higiene/productes-quimics](http://www.upc.edu/prevencio/ca/seguretat-higiene/productes-quimics)
